About the Author

Çağatay Çivici is a member of JavaServer Faces Expert Group, the founder of PrimeFaces, PrimeNG, PrimeReact, PrimeUI and a PMC member of open source JSF implementation Apache MyFaces. He is a recognized speaker in international conferences and in many local events.

1. Introduction

1.1 What is PrimeFaces?

PrimeFaces is an open source JSF component suite with various extensions.

- Rich set of components (HtmlEditor, Dialog, AutoComplete, Charts and many more).
- Built-in Ajax based on standard JSF Ajax APIs.
- Lightweight, one jar, zero-configuration and no required dependencies.
- Push support via Atmosphere Framework.
- Mobile UI kit to create mobile web applications.
- Skinning Framework with 35+ built-in themes and support for visual theme designer tool.
- Premium themes and layouts
- Extensive documentation.
- Large, vibrant and active user community.
- Developed with "passion" from application developers to application developers.

2. Setup

2.1 Download

PrimeFaces has a single jar called [primefaces-11.0.0.jar](#). There are two ways to download this jar, you can either download from PrimeFaces homepage or if you are a maven user you can define it as a dependency.

Download Manually

Manual downloads are actually links to the maven repository, for more information please visit;

[PrimeFaces Maven Repository](#)

Download with Maven

Group id is *org.primefaces* and artifact id is *primefaces*.

2.2 Dependencies

PrimeFaces only requires a JAVA 5+ runtime and a JSF 2.x implementation as mandatory dependencies. There're some optional libraries for certain features. Licenses of all dependencies and any 3rd part work incorporated are compatible with the PrimeFaces Licenses.

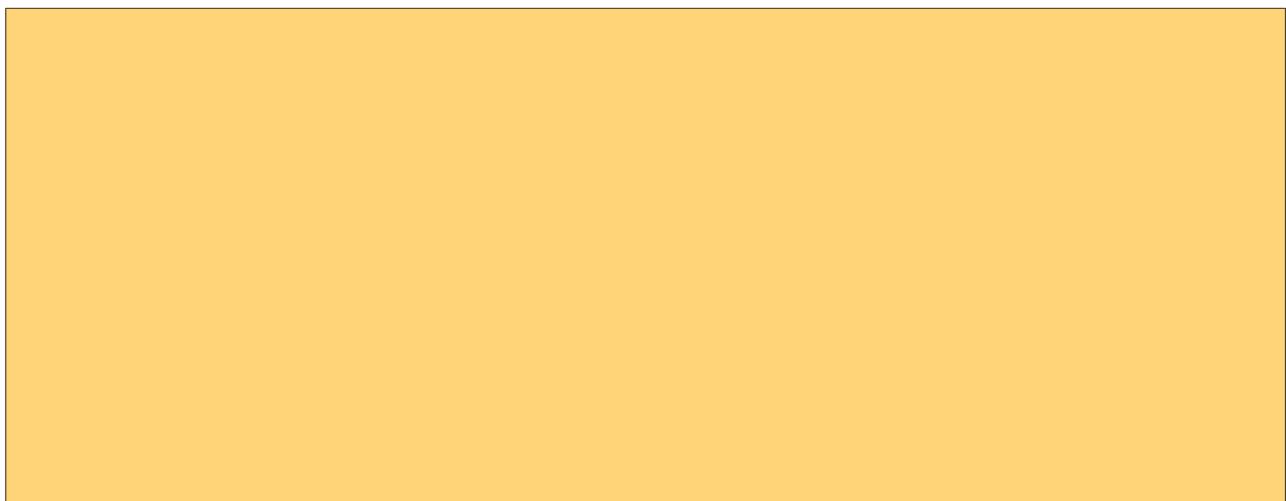

JSF runtime	2.0, 2.1, 2.2, 2.3	Required	Apache MyFaces or Oracle Mojarra
itext	2.1.7	Optional	DataExporter (PDF)
apache poi	3.13	Optional	DataExporter (Excel)
rome	1.0	Optional	FeedReader
commons-fileupload	1.3	Optional	FileUpload
commons-io	2.2	Optional	FileUpload
atmosphere	2.4.6	Optional	PrimeFaces Push
barcode4j-light	2.1	Optional	Barcode
qrigen	1.4	Optional	QR Code support for Barcode

* Listed versions are tested and known to be working with PrimeFaces, other versions of these dependencies may also work but not tested.

JSF Runtime

PrimeFaces supports JSF 2.0, 2.1, 2.2 and 2.3 runtimes at the same time using feature detection and by not having compile time dependency to a specific version. As a result some features are only available depending on the runtime.

A good example for runtime compatibility is the passthrough attributes, a JSF 2.2 specific feature to display dynamic attributes. In following page, pass through attribute placeholder only gets rendered if the runtime is JSF 2.2.

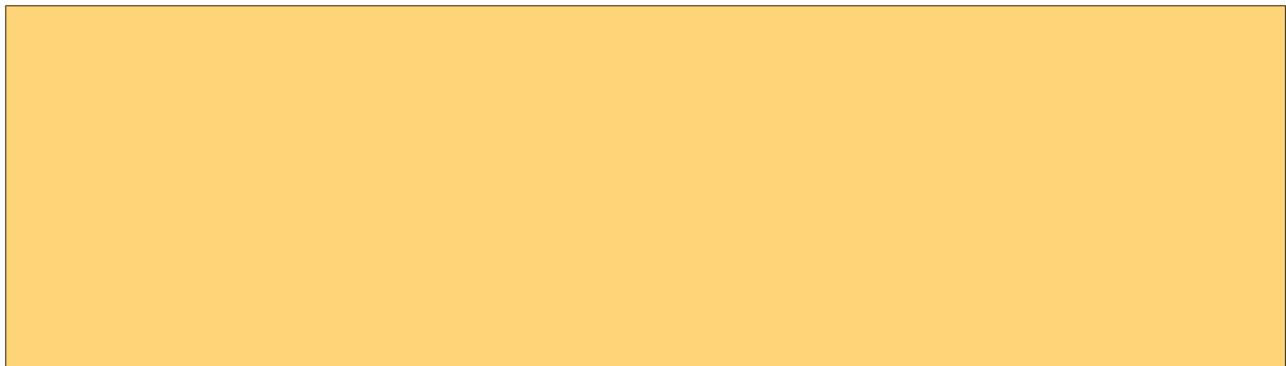

2.3 Configuration

PrimeFaces does not require any mandatory configuration and follows configuration by exception pattern of JavaEE. Here is the list of all configuration options defined with a context-param such as;

THEME	omega	Theme of the application.
mobile.THEME	null	Theme of the mobile application.
PUSH_SERVER_URL	null	Custom server url for PrimeFaces Push.
SUBMIT	full	Defines ajax submit mode, <i>full</i> or <i>partial</i> .
DIR	ltr	Defines orientation, <i>ltr</i> or <i>rtl</i> .
RESET_VALUES	false	When enabled, ajax updated inputs are reset.
SECRET	primefaces	Secret key to encrypt-decrypt value expressions exposed in rendering StreamedContents.
CLIENT_SIDE_VALIDATION	false	Controls client side validation.
UPLOADER	auto	Defines uploader mode; <i>auto</i> , <i>native</i> or <i>commons</i> .
TRANSFORM_METADATA	false	Transforms bean validation metadata to html attributes.
LEGACY_WIDGET_NAMESPACE	false	Enables window scope so that widgets can be accessed using <i>widgetVar.method()</i> in addition to default PF namespace approach like <i>PF('widgetVar').method()</i> .
FONT_AWESOME	false	Enabled font-awesome icons.
INTERPOLATE_CLIENT_SIDE_VALIDATION_MESSAGES	false	Whether to load the CSV messages from server.

2.4 Hello World

Once you have added the primefaces jar to your classpath, you need to add the PrimeFaces namespace to your page to begin using the components. Here is a simple page like test.xhtml;

When you run this page through Faces Servlet mapping e.g. *.jsf, you should see a rich text editor when you run the page with test.jsf.

3. Component Suite

3.1 AccordionPanel

AccordionPanel is a container component that displays content in stacked format.

▼ Godfather Part I

The story begins as Don Vito Corleone, the head of a New York Mafia family, oversees his daughter's wedding. His beloved son Michael has just come home from the war, but does not intend to become part of his father's business. Through Michael's life the nature of the family-business becomes clear. The business of the family is just like the head of the family, kind and benevolent to those who give respect, but given-to ruthless violence whenever

Renderer Class	

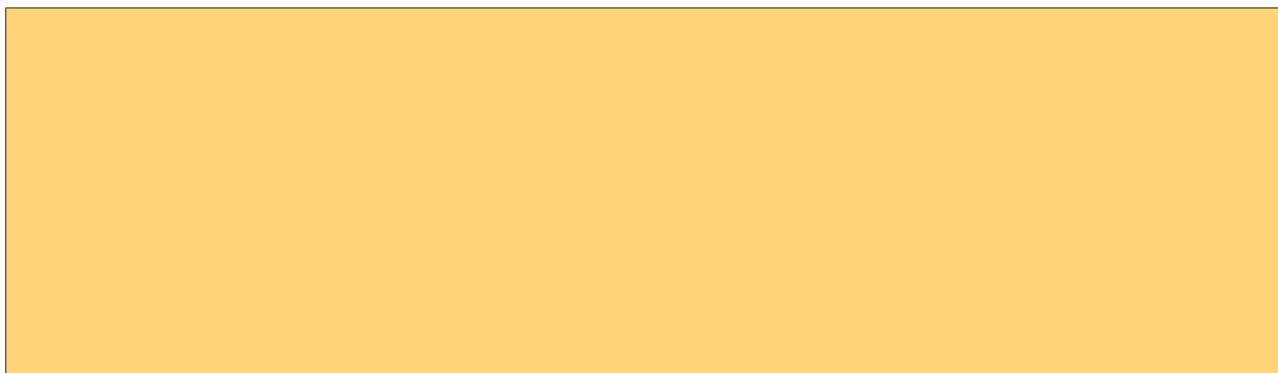

Attributes

id	null	String	Unique identifier of the component
rendered	true	boolean	Boolean value to specify the rendering of the component.
binding	null	Object	An EL expression that maps to a server side UIComponent instance in a backing bean.
activeIndex	false	String	Index of the active tab or a comma separated string of indexes when multiple mode is on.

style	null	String	Inline style of the container element.
styleClass	null	String	Style class of the container element.
onTabChange	null	String	Client side callback to invoke when an inactive tab is clicked.
onTabShow	null	String	Client side callback to invoke when a tab gets activated.
onTabClose	null	String	Client side callback to invoke when a tab is closed.
dynamic	false	Boolean	Defines the toggle mode.
cache	true	Boolean	Defines if activating a dynamic tab should load the contents from server again.
value	null	List	List to iterate to display dynamic number of tabs.
var	null	String	Name of iterator to use in a dynamic number of tabs.
multiple	false	Boolean	Controls multiple selection.
dir	ltr	String	Defines text direction, valid values are <i>ltr</i> and <i>rtl</i> .
prependId	true	Boolean	AccordionPanel is a naming container thus prepends its id to its children by default, a false value turns this behavior off except for dynamic tabs.
widgetVar	null	String	Name of the client side widget.
tabindex	0	String	Position of the headers in the tabbing order.
tabController	null	MethodEx pr	Server side listener to decide whether a tab change or tab close should be allowed.

Getting Started with Accordion Panel

Accordion panel consists of one or more tabs and each tab can group any content. Titles can also be defined with “title” facet.

Dynamic Content Loading

AccordionPanel supports lazy loading of tab content, when dynamic option is set true, only active tab contents will be rendered to the client side and clicking an inactive tab header will do an ajax request to load the tab contents.

This feature is useful to reduce bandwidth and speed up page loading time. By default activating a previously loaded dynamic tab does not initiate a request to load the contents again as tab is cached. To control this behavior use *cache* option.

Client Side Callbacks

onTabChange is called before a tab is shown and *onTabShow* is called after. Both receive container element of the tab to show as the parameter.

Ajax Behavior Events

tabChange and *tabClose* are the ajax behavior events of accordion panel. An example with *tabChange* would be;

Your listener(if defined) will be invoked with an *org.primefaces.event.TabChangeEvent* instance that contains a reference to the new active tab and the accordion panel itself. Similarly *org.primefaces.event.TabCloseEvent* is passed to the listener of *tabClose* event when an active tab is closed.

Dynamic Number of Tabs

When the tabs to display are not static, use the built-in iteration feature similar to ui:repeat.

” ” ” ”

Disabled Tabs

A tab can be disabled by setting disabled attribute to true.

” ”

Multiple Selection

By default, only one tab at a time can be active, enable *multiple* mode to activate multiple tabs.

” ”

TabController

TabController is a server side listener that can be utilized to decide if a client side tab change or tab close action is allowed. When one of these two events occur, an ajax call is made to invoke the tab controller, then the boolean return value of this controller is sent back to click to decide if the event should be performed. An example use case is disallowing tab change if current tab has invalid inputs.

Client Side API

Widget: *PrimeFaces.widget.AccordionPanel*

select(index)	index: Index of tab	void	Activates tab with given index.
unselect(index)	index: Index of tab	void	Deactivates tab with given index.

Skinning

AccordionPanel resides in a main container element which *style* and *styleClass* options apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-accordion	Main container element
.ui-accordion-header	Tab header
.ui-accordion-content	Tab content

3.2 AjaxBehavior

AjaxBehavior is an extension to standard f:ajax.

Info

Tag	
Behavior Id	
Behavior Class	

Attributes

listener	null	Method Expr	Method to process in partial request.
immediate	false	boolean	Boolean value that determines the phaseId, when true actions are processed at apply_request_values, when false at invoke_application phase.
async	false	Boolean	When set to true, ajax requests are not queued.
process	null	String	Component(s) to process in partial request.
update	null	String	Component(s) to update with ajax.
onstart	null	String	Callback to execute before ajax request begins.
oncomplete	null	String	Callback to execute when ajax request is completed.
onsuccess	null	String	Callback to execute when ajax request succeeds.
onerror	null	String	Callback to execute when ajax request fails.
global	true	Boolean	Global ajax requests are listened by ajaxStatus component, setting global to false will not trigger ajaxStatus.
delay	null	String	If less than <i>delay</i> milliseconds elapses between calls to <i>request()</i> only the most recent one is sent and all other requests are discarded. If this option is not specified, or if the value of <i>delay</i> is the literal string 'none' without the quotes, no delay is used.
partialSubmit	false	Boolean	Enables serialization of values belonging to the partially processed components only.
partialSubmitFilter	null	String	Selector to use when partial submit is on, default is ":input" to select all descendant inputs of a partially processed components.
disabled	false	Boolean	Disables ajax behavior.

event	null	String	Client side event to trigger ajax request.
resetValues	false	Boolean	If true, local values of input components to be updated within the ajax request would be reset.
ignoreAutoUpdate	false	Boolean	If true, components which autoUpdate="true" will not be updated for this request. If not specified, or the value is false, no such indication is made.
form	null	String	Form to serialize for an ajax request. Default is the enclosing form.
skipChildren	true	Boolean	Containers components like, datatable, panel, tabview skip their children if the request owner is them. For example, sort, page event of a datatable. As children are skipped, input values get lost, assume a case with a datatable and inputs components in a column. Sorting the column discards the changes and data is sorted according to original value. Setting skipChildren to false, enabled input values to update the value and sorting to be happened with user values.

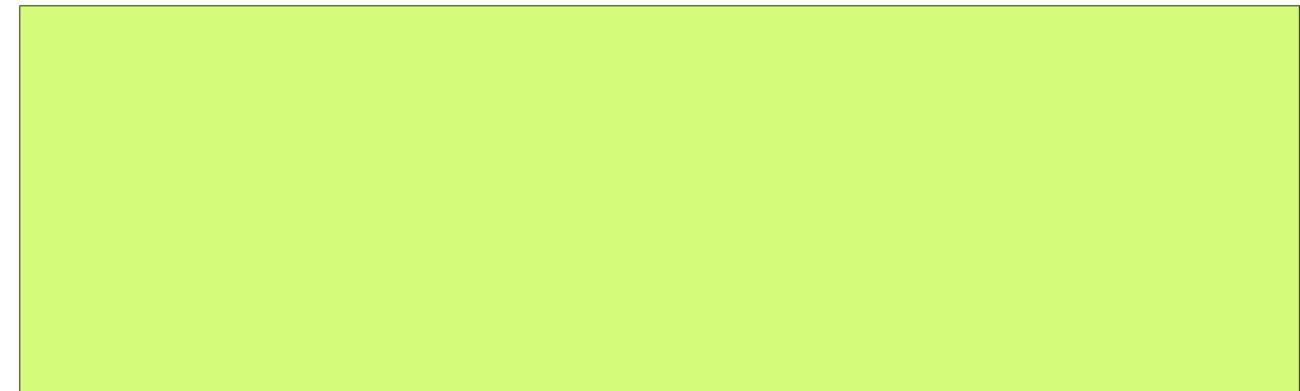

Getting Started with AjaxBehavior

AjaxBehavior is attached to the component to ajaxify.

In the example above, each time the input changes, an ajax request is sent to the server. When the response is received output text with id "out" is updated with value of the input.

Listener

In case you need to execute a method on a backing bean, define a listener;

Events

Default client side events are defined by components that support client behaviors, for input components it is *onchange* and for command components it is *onclick*. In order to override the dom event to trigger the ajax request use *event* option. In following example, ajax request is triggered when key is up on input field.

3.3 AjaxExceptionHandler

AjaxExceptionHandler is a utility component for the built-in ExceptionHandler.

Info

Tag	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
onexception	null	String	Client side callback to execute after a exception with this type occured.
update	null	String	Components to update after a exception with this type occured.
type	null	String	Exception type to handle.

Getting Started with AjaxExceptionHandler

Find the detailed information about this component at ExceptionHandler section at Utilities chapter.

3.4 AjaxStatus

AjaxStatus is a global notifier for ajax requests.

Info

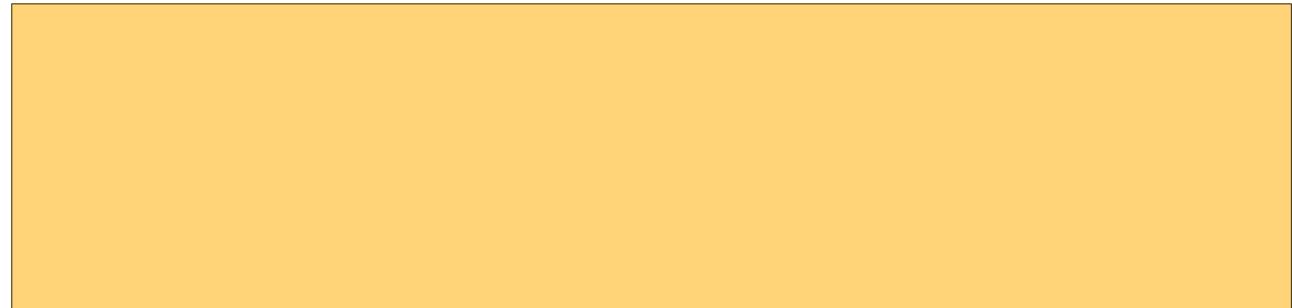

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

<code>id</code>	null	String	Unique identifier of the component.
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>onstart</code>	null	String	Client side callback to execute after ajax requests start.
<code>oncomplete</code>	null	String	Client side callback to execute after ajax requests complete.
<code>onsuccess</code>	null	String	Client side callback to execute after ajax requests completed successfully.
<code>onerror</code>	null	String	Client side callback to execute when an ajax request fails.
<code>style</code>	null	String	Inline style of the component.
<code>styleClass</code>	null	String	Style class of the component.
<code>widgetVar</code>	null	String	Name of the client side widget.

Getting Started with AjaxStatus

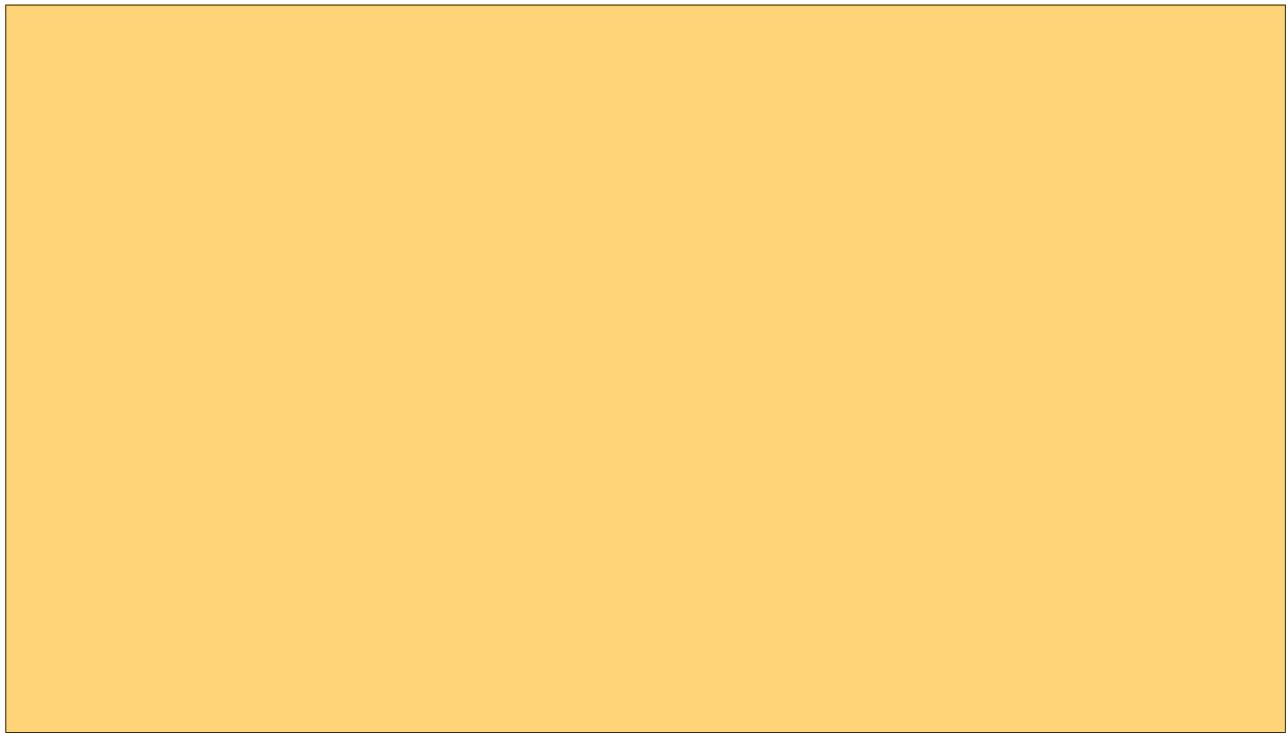

AjaxStatus uses facets to represent the request status. Most common used facets are *start* and *complete*. Start facet will be visible once ajax request begins and stay visible until it's completed. Once the ajax response is received and page is updated, start facet gets hidden and complete facet shows up.

Events

Here is the full list of available event names;

- : Initially visible when page is loaded.
- : Before ajax request begins.
- : When ajax response is received without error.
- : When ajax response is received with an http error.
- : When everything finishes.

Custom Events

Facets are the declarative way to use, if you'd like to implement advanced cases with scripting you can take advantage of `on*` callbacks which are the event handler counterparts of the facets.

A common usage of programmatic approach is to implement a custom status dialog;

Client Side API

Widget: *PrimeFaces.widget.AjaxStatus*

trigger(event)	event: Name of event.	void	Triggers given event.

Skinning

AjaxStatus is equipped with *style* and *styleClass*. Styling directly applies to a container element which contains the facets.

Tips

- Avoid updating ajaxStatus itself to prevent duplicate facet/callback bindings.
- Provide a fixed width/height to an inline ajaxStatus to prevent page layout from changing.
- Components like commandButton has an attribute (*global*) to control triggering of AjaxStatus.
- AjaxStatus also supports core JSF ajax requests of f:ajax as well.

3.5 AutoComplete

AutoComplete provides live suggestions while an input is being typed.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
value	null	Object	Value of the component than can be either an EL expression of a literal text.
converter	null	Object	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id.

autocomplete	null	String	Controls browser autocomplete behavior.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
disabled	false	Boolean	Disables input field
label	null	String	A localized user presentable name.
lang	null	String	Code describing the language used in the generated markup for this component.
maxlength	null	Integer	Maximum number of characters that may be entered in this field.
onblur	null	String	Client side callback to execute when input element loses focus.
onchange	null	String	Client side callback to execute when input element loses focus and its value has been modified since gaining focus.
onclick	null	String	Client side callback to execute when input element is clicked.
ondblclick	null	String	Client side callback to execute when input element is double clicked.
onfocus	null	String	Client side callback to execute when input element receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over input element.
onkeypress	null	String	Client side callback to execute when a key is pressed and released over input element.
onkeyup	null	String	Client side callback to execute when a key is released over input element.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over input element
onmousemove	null	String	Client side callback to execute when a pointer button is moved within input element.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from input element.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto input element.
onmouseup	null	String	Client side callback to execute when a pointer button is released over input element.
onselect	null	String	Client side callback to execute when text within input element is selected by user.

	placeholder	null	String
	readonly	false	Boolean
Integer	size	null	Integer
	style	null	String
	styleClass	IUP\$ri)/element.SyllleClassSWSeggerS[Style	

moreText	...	String	The text shown in panel when the suggested list is greater than maxResults.

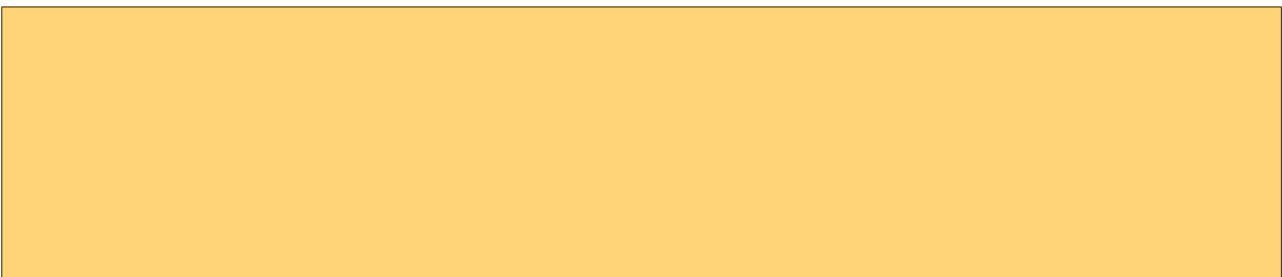

Getting Started with AutoComplete

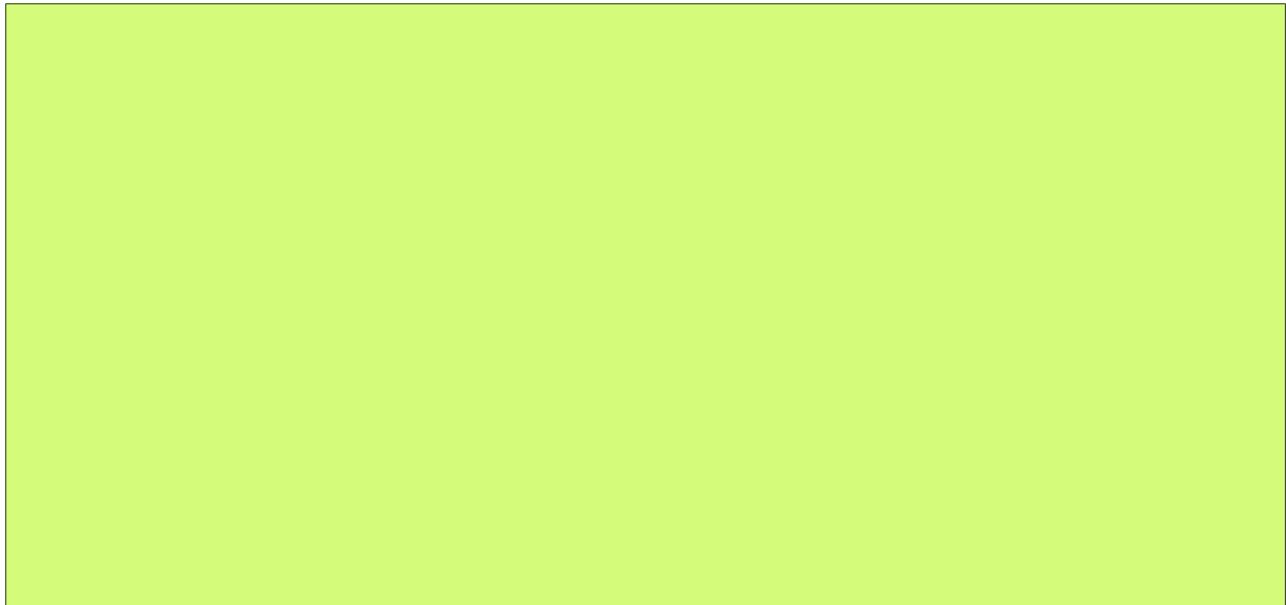

AutoComplete is an input component so it requires a value as usual. Suggestions are loaded by calling a server side completeMethod that takes a single string parameter which is the text entered.

Pojo Support

Most of the time, instead of simple strings you would need work with your domain objects, autoComplete supports this common use case with the use of a converter and data iterator. Following example loads a list of players, itemLabel is the label displayed as a suggestion and itemValue is the submitted value. Note that when working with pojos, you need to plug-in your own converter.

Limiting the Results

Number of results shown can be limited, by default there is no limit. When the suggestions exceed the number of results, a text defined by *moreText* is displayed to indicate this case. There is no default action when the *moreText* is clicked, you need to use *moreText* ajax behavior event to handle more results.

Minimum Query Length

By default queries are sent to the server and *completeMethod* is called as soon as users starts typing at the input text. This behavior is tuned using the *minQueryLength* attribute.

With this setting, suggestions will start when user types the 3rd character at the input field.

Query Delay

AutoComplete is optimized using *queryDelay* option, by default *autoComplete* waits for 300 milliseconds to query a suggestion request, if you'd like to tune the load balance, give a longer value. Following *autoComplete* waits for 1 second after user types an input.

Custom Content

AutoComplete can display custom content by nesting columns.

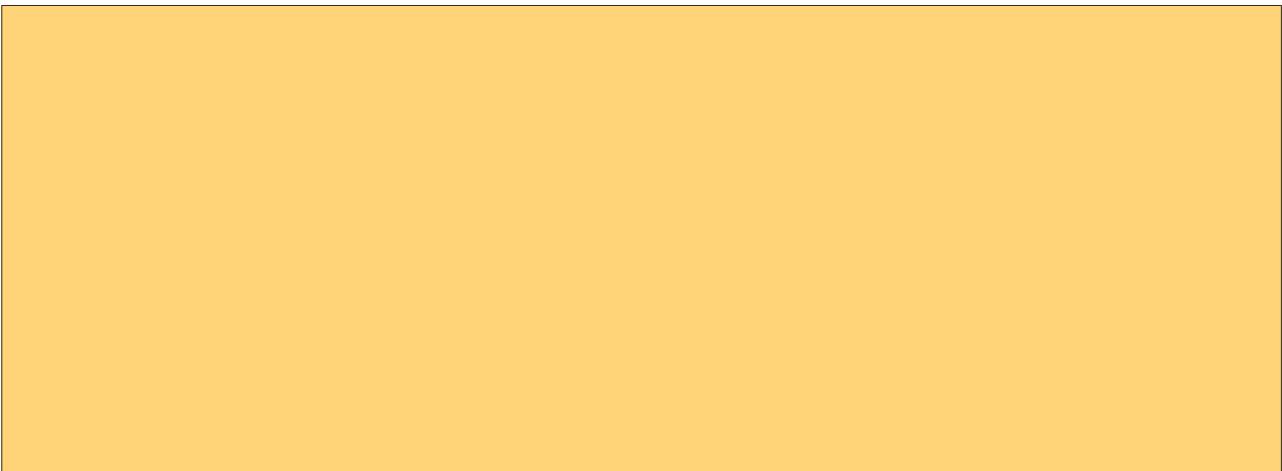

Dropdown Mode

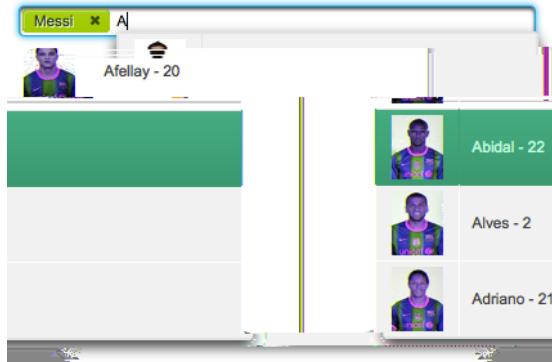

When dropdown mode is enabled, a dropdown button is displayed next to the input field. Depending on dropdownMode configuration, clicking this button will either do a search with an empty query or search with the current value in input.

Multiple Selection

AutoComplete supports multiple selection as well, to use this feature set multiple option to true and define a list as your backend model. Following example demonstrates multiple selection with custom content support.

Caching

Suggestions can be cached on client side so that the same query does not do a request which is likely to return same suggestions again. To enable this, set `cache` option to true. There is also a `cacheTimeout` option to configure how long it takes to clear a cache automatically.

Ajax Behavior Events

Instead of waiting for user to submit the form manually to process the selected item, you can enable instant ajax selection by using the `itemSelect` ajax behavior. Example below demonstrates how to display a message about the selected item instantly.

" "

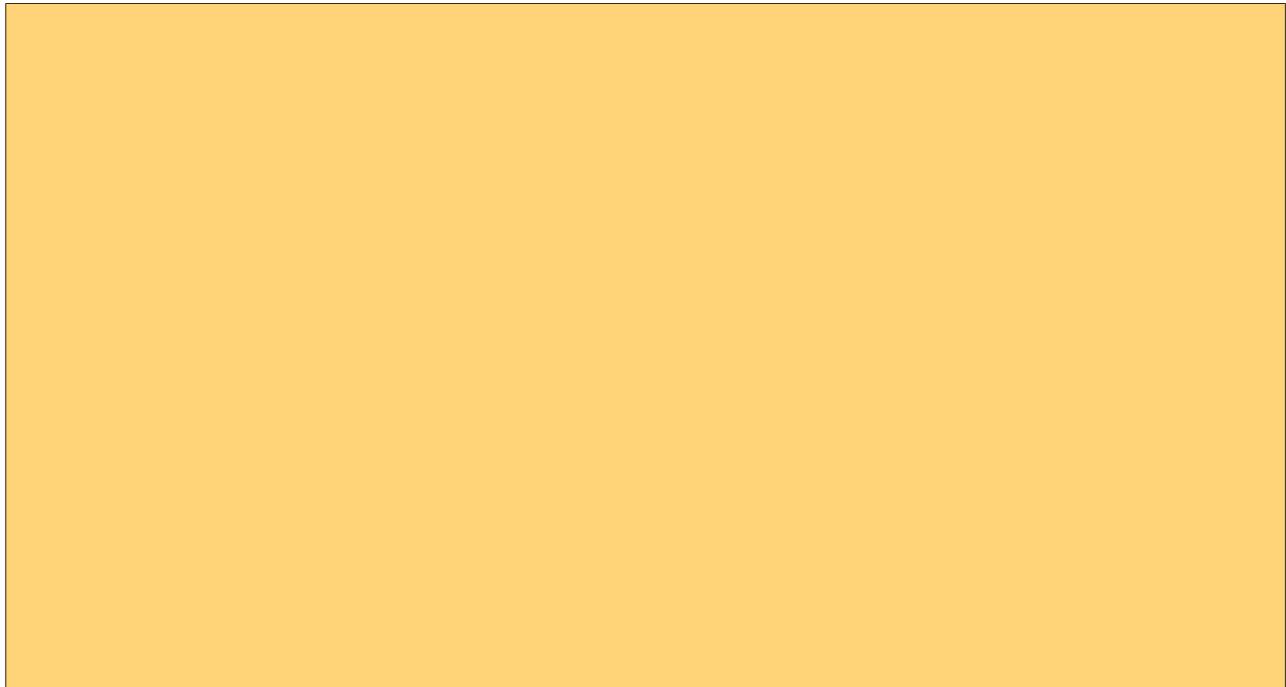

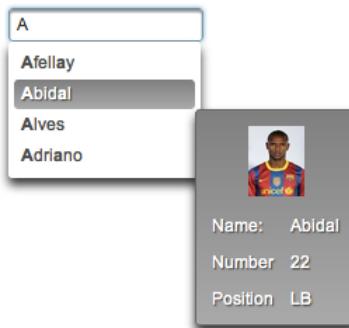

Your listener(if defined) will be invoked with an `org.primefaces.event.Select` instance that contains a reference to the selected item. Note that autoComplete also supports events inherited from regular input text such as blur, focus, mouseover in addition to `itemSelect`. Similarly, `itemUnselect` event is

provided for multiple autocomplete when an item is removed by clicking the remove icon. In this case `org.primefaces.event.Unselect` instance is passed to a listener if defined.

itemSelect	org.primefaces.event.SelectEvent	On item selection.
itemUnselect	org.primefaces.event.UnselectEvent	On item unselection.
query	-	On query.
moreText	-	When moreText is clicked.

ItemTip

Itemtip is an advanced built-in tooltip when mouse is over on suggested items. Content of the tooltip is defined via the `itemtip` facet.

Client Side API

Widget: `PrimeFaces.widget.AutoComplete`

search(value)	value: keyword for search	void	Initiates a search with given value
close()	-	void	Hides suggested items menu
disable()	-	void	Disables the input field
enable()	-	void	Enables the input field
deactivate()	-	void	Deactivates search behavior
activate()	-	void	Activates search behavior

Skinning

Following is the list of structural style classes;

.ui-autocomplete	Container element.
.ui-autocomplete-input	Input field.
.ui-autocomplete-panel	Container of suggestions list.
.ui-autocomplete-items	List of items
.ui-autocomplete-item	Each item in the list.
.ui-autocomplete-query	Highlighted part in suggestions.

As skinning style classes are global, see the main theming section for more information.

Tips

- Do not forget to use a converter when working with pojos.
- Enable forceSelection if you would like to accept values only from suggested list.
- Increase query delay to avoid unnecessary load to server as a result of user typing fast.
- Use emptyMessage option to provide feedback to the users that there are no suggestions.
- Enable caching to avoid duplicate queries.

3.6 Barcode

Barcode component is used to display various barcode formats.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Binary data to stream or context relative path.
type	null	String	Type of the barcode.
cache	true	Boolean	Controls browser caching mode of the resources.
format	svg	String	Format of the generated barcode, valid values are "svg" (default) and "png".
orientation	0	Integer	Orientation in terms of angle. (0, 90, 180, 270)
alt	null	String	Alternate text for the image
url	null	String	Alias to value attribute

width	null	String	Width of the image
height	null	String	Height of the image
title	null	String	Title of the image
dir	null	String	Direction of the text displayed
lang	null	String	Language code
ismap	false	Boolean	Specifies to use a server-side image map
usemap	null	String	Name of the client side map
style	null	String	Style of the image
styleClass	null	String	Style class of the image
onclick	null	String	onclick dom event handler
ondblclick	null	String	ondblclick dom event handler
onkeydown	null	String	onkeydown dom event handler
onkeypress	null	String	onkeypress dom event handler
onkeyup	null	String	onkeyup dom event handler
onmousedown	null	String	onmousedown dom event handler
onmousemove	null	String	onmousemove dom event handler
onmouseout	null	String	onmouseout dom event handler
onmouseover	null	String	onmouseover dom event handler
onmouseup	null	String	onmouseup dom event handler

Getting started with Barcode

Barcode type should be provided along with the value to display. Supported formats are;

- int2of5
- codabar
- code39
- code128
- ean8
- ean13
- upca
- postnet
- pdf417
- datamatrix
- qr

Value can also be retrieved from a backend value.

Format

Default display format is *svg* and other possible option is *png*. In case the client browser does not support *svg* e.g. IE8, barcode automatically chooses *png* format.

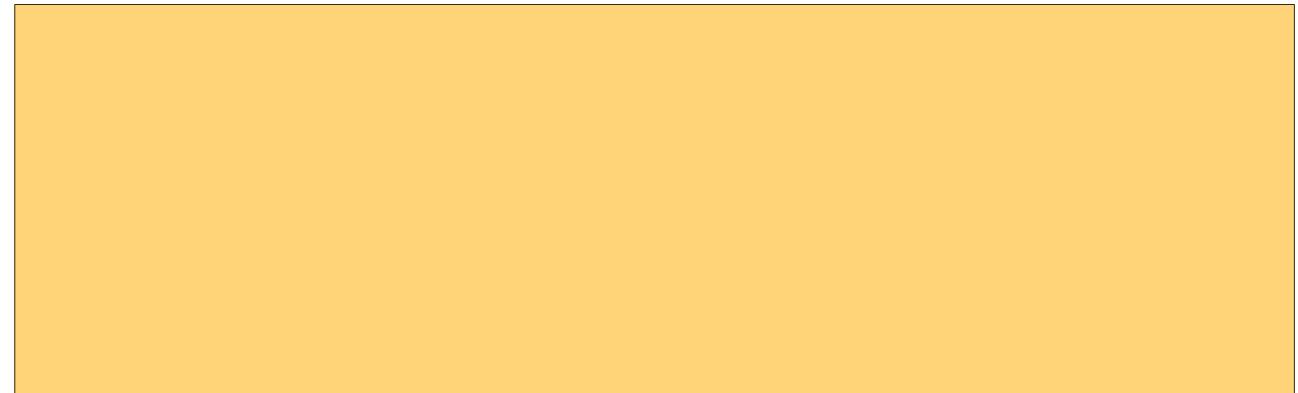

Orientation

In order to change the orientation, choose the angle from the 4 pre-defined values.

Dependencies

Barcode component uses *barcode4j* library underneath except QR code support, which is handled by *qrcode4j* library. Following versions are supported officially.

* barcode4j 2.1 does not exist in maven central repository so manual installation is necessary for maven users.

3.7 BlockUI

BlockUI is used to block interactivity of JSF components with optional ajax integration.

Ajax Pagination			
Model	Year	Manufacturer	Color
9816c1c9	2001	Opel	Yellow
43fb87ae	1993	Renault	White
e2cb6c1a	1998	Mercedes	White
aac257b5	1984		Green
7aa229b6	1990		White
65d3dc85	1960		Silver
61752724	2009	Opel	Red
c620f632	1983	Volkswagen	White
3066aea8	1998	Audi	Black
3fd09492	1991	Renault	Black

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

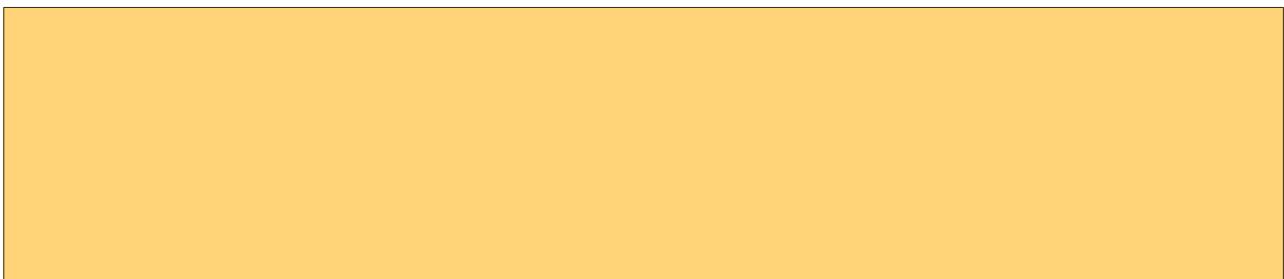

Attributes

<code>id</code>	<code>null</code>	<code>String</code>	Unique identifier of the component.
<code>rendered</code>	<code>true</code>	<code>Boolean</code>	Boolean value to specify the rendering of the component.
<code>binding</code>	<code>null</code>	<code>Object</code>	An el expression that maps to a server side UIComponent instance in a backing bean
<code>widgetVar</code>	<code>null</code>	<code>String</code>	Name of the client side widget.
<code>trigger</code>	<code>null</code>	<code>String</code>	Identifier of the component(s) to bind.

block	null	String	Search expression for block targets.
blocked	false	Boolean	Blocks the UI by default when enabled.
animate	true	Boolean	When disabled, displays block without animation effect.
styleClass	null	String	Style class of the component.

Getting Started with BlockUI

BlockUI requires *trigger* and *block* attributes to be defined. With the special ajax integration, ajax requests whose source are the trigger components will block the ui onstart and unblock oncomplete. Example below blocks the ui of the panel when saveBtn is clicked and unblock when ajax response is received.

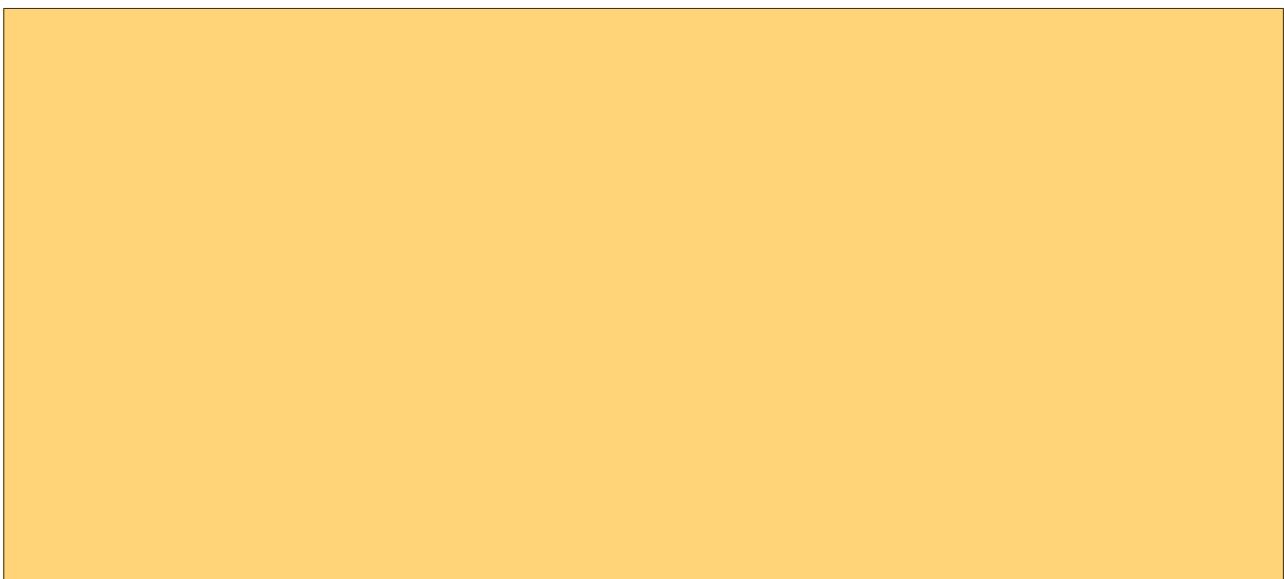

Multiple triggers are defined as a comma separated list. Multiple block targets are also possible using a search expression.

Custom Content

In order to display custom content like a loading text and animation, place the content inside the blockUI.

Client Side API

Widget: *PrimeFaces.widget.BlockUI*

show()	-	void	Blocks the UI.
hide()	-	void	Unblocks the UI

Skinning

Following is the list of structural style classes;

.ui-blockui	Container element.
.ui-blockui-content	Container for custom content.

As skinning style classes are global, see the main theming section for more information.

Tips

- BlockUI does not support absolute or fixed positioned components. e.g. dialog.

3.8 BreadCrumb

Breadcrumb is a navigation component that provides contextual information about page hierarchy in the workflow.

Info

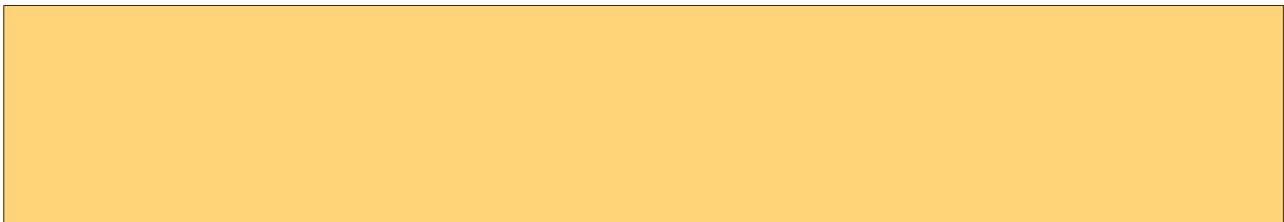

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
model	null	MenuModel	MenuModel instance to create menus programmatically
style	null	String	Style of main container element.
styleClass	null	String	Style class of main container
homeDisplay	icon	String	Defines display mode of root link, valid values are "icon" default and "text".

Getting Started with BreadCrumb

Steps are defined as child menuitem components in breadcrumb.

Dynamic Menus

Menus can be created programmatically as well, see the dynamic menus part in menu component section for more information and an example.

Options Facet

In order to place custom content inside breadcrumb, options facet is provided. Options facet content is aligned right by default.

Skinning

Breadcrumb resides in a container element that *style* and *styleClass* options apply. Following is the list of structural style classes;

.ui-breadcrumb	Main breadcrumb container element.
.ui-breadcrumb .ui-menu-item-link	Each menuitem.
.ui-breadcrumb .ui-menu-item-text	Each menuitem label.
.ui-breadcrumb-chevron	Separator of menuitems.

As skinning style classes are global, see the main theming section for more information.

- If there is a dynamic flow, use model option instead of creating declarative p:menuitem components and bind your MenuModel representing the state of the flow.
- Breadcrumb can do ajax/non-ajax action requests as well since p:menuitem has this option. In this case, breadcrumb must be nested in a form.
- url option is the key for a menuitem, if it is defined, it will work as a simple link. If you'd like to use menuitem to execute command with or without ajax, do not define the url option.

3.9 Button

Button is an extension to the standard h:button component with skinning capabilities.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
widgetVar	null	String	Name of the client side widget.
value	null	Object	Value of the component than can be either an EL expression or a literal text.
outcome	null	String	Used to resolve a navigation case.
includeViewParams	false	Boolean	Whether to include page parameters in target URI
fragment	null	String	Identifier of the target page which should be scrolled to.
disabled	false	Boolean	Disables button.
accesskey	null	String	Access key that when pressed transfers focus to button.
alt	null	String	Alternate textual description.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
image	null	String	Style class for the button icon. (deprecated: use icon)
lang	null	String	Code describing the language used in the generated markup

			for this component.
onblur	null	String	Client side callback to execute when button loses focus.
onchange	null	String	Client side callback to execute when button loses focus and its value has been modified since gaining focus.
onclick	null	String	Client side callback to execute when button is clicked.
ondblclick	null	String	Client side callback to execute when button is double clicked.
onfocus	null	String	Client side callback to execute when button receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over button.
onkeypress	null	String	Client side callback to execute when a key is pressed and released over button.
onkeyup	null	String	Client side callback to execute when a key is released over button.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over button.
onmousemove	null	String	Client side callback to execute when a pointer button is moved within button
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from button.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto button.
onmouseup	null	String	Client side callback to execute when a pointer button is released over button.
style	null	String	Inline style of the button.
styleClass	null	String	Style class of the button.
tabindex	null	Integer	Position in the tabbing order.
title	null	String	Advisory tooltip information.
href	null	String	Resource to link directly to implement anchor behavior.
icon	null	String	Icon of the button.
iconPos	left	String	Position of the button icon.
target	_self	String	The window target.
escape	true	Boolean	Defines whether label would be escaped or not.
inline	false	String	Displays as inline instead of 100% width, mobile only.
disableClientWindow	false	Boolean	Disable appending the ClientWindow

			on the rendering of this element.

Getting Started with Button

p:button usage is same as standard h:button, an outcome is necessary to navigate using GET requests. Assume you are at source.xhtml and need to navigate target.xhtml.

Parameters

Parameters in URI are defined with nested <f:param /> tags.

Icons

Icons for button are defined via css and *icon* attribute, if you use title instead of value, only icon will be displayed and title text will be displayed as tooltip on mouseover. You can also use icons from PrimeFaces themes such ui-icon-check.

Skinning

Button renders a *button* tag which *style* and *styleClass* applies. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-button	Button element
.ui-button-text-only	Button element when icon is not used
.ui-button-text	Label of button

3.10 Cache

Cache component is used to reduce page load time by caching the content after initial rendering.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

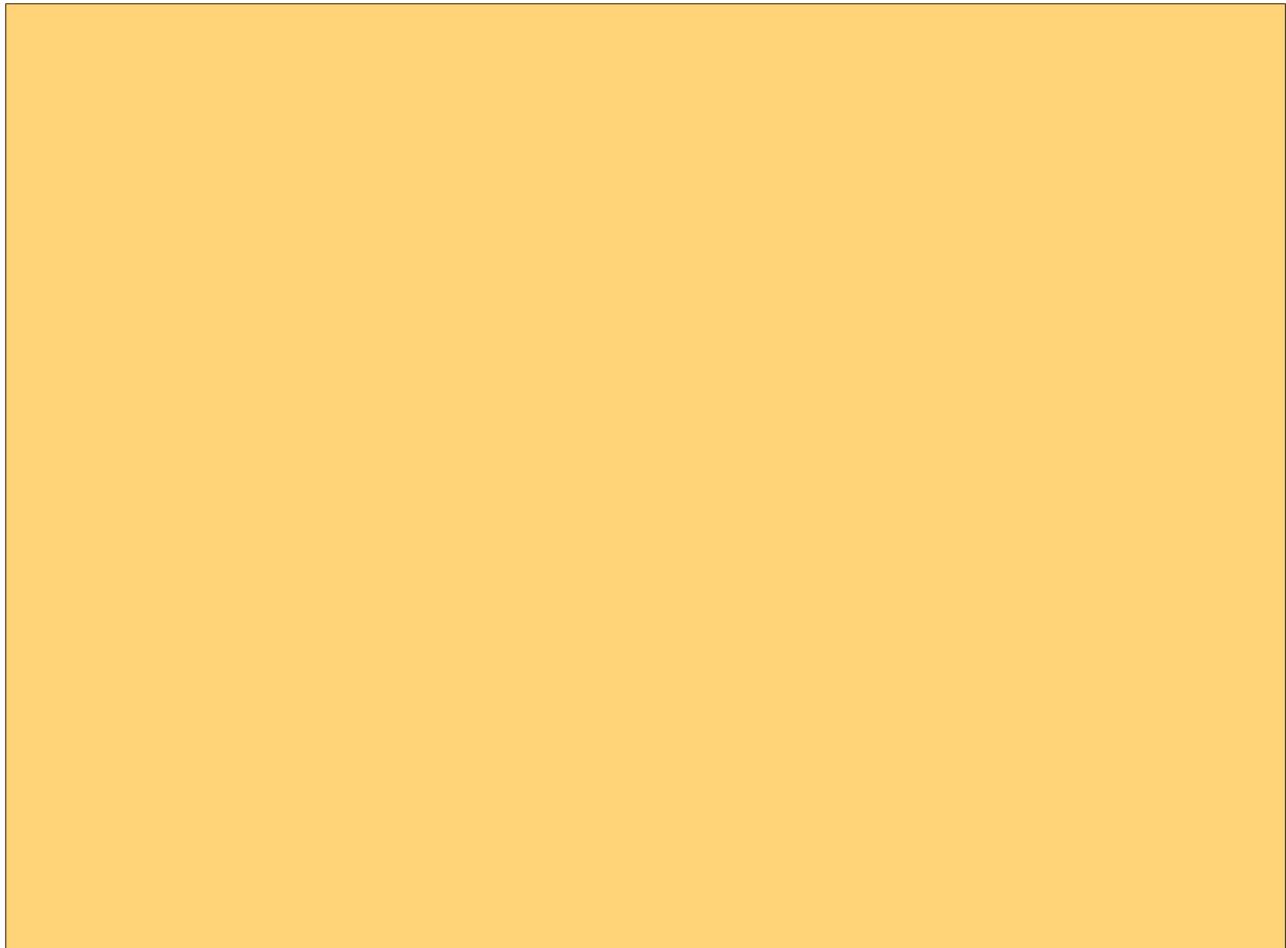

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
disabled	false	Boolean	Disables caching.
region	View Id	String	Unique id of the cache region, defaults to view id.
key	null	String	Unique id of the cache entry in region, defaults to client id of component.
processEvents	false	Boolean	When enabled, lifecycle events such as button actions are executed.

Getting Started with Cache

A cache store is required to use the cache component, two different providers are supported as cache implementation; EHCache and Hazelcast. Provider is configured via a context-param.

Here is a sample ehcache.xml to configure cache regions, there are two regions in this configuration.

After the configuration, at UI side, the cached part needs to be wrapped inside the p:cache component.

Once the page is loaded initially, content inside p:cache component is cached inside the cache region of the cache provider. Postbacks on the same page or reopening the page retrieve the output from cache instead of rendering the content regularly.

Cache Provider API

CacheProvider can be accessed via;

```
RequestContext.getCurrentInstance().getApplicationContext().getCacheProvider()
```

For example using this API, all cache regions can be cleaned using *clear()* method. Refer to javadoc of CacheProvider for the full list of available methods.

3.11 Calendar

Calendar is an input component used to select a date featuring display modes, paging, localization, ajax selection and more.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	java.util.Date	Value of the component
converter	null	Converter/String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required

validator	null	Method Expr	A method expression that refers to a method validating the input
valueChangeListener	null	Method Expr	A method expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fails.
widgetVar	null	String	Name of the client side widget.
mindate	null	Date or String	Sets calendar's minimum visible date
maxdate	null	Date or String	Sets calendar's maximum visible date
pages	1	Integer	Enables multiple page rendering.
disabled	false	Boolean	Disables the calendar when set to true.
mode	popup	String	Defines how the calendar will be displayed.
pattern	MM/dd/yyyy	String	DateFormat pattern for localization
locale	null	Object	Locale to be used for labels and conversion.
navigator	false	Boolean	Enables month/year navigator
timeZone	null	Time Zone	String or a java.util.TimeZone instance to specify the timezone used for date conversion, defaults to TimeZone.getDefault()
readonlyInput	false	Boolean	Makes input text of a popup calendar readonly.
showButtonPanel	false	Boolean	Visibility of button panel containing today and done buttons.
effect	null	String	Effect to use when displaying and showing the popup calendar.
effectDuration	normal	String	Duration of the effect.
showOn	both	String	Client side event that displays the popup calendar.
showWeek	false	Boolean	Displays the week number next to each week.
disabledWeekends	false	Boolean	Disables weekend columns.
showOtherMonths	false	Boolean	Displays days belonging to other months.
selectOtherMonths	false	Boolean	Enables selection of days belonging to other months.
yearRange	null	String	Year range for the navigator, default "c-10:c+10"

timeOnly	false	Boolean	Shows only timepicker without date.
stepHour	1	Integer	Hour steps.
stepMinute	1	Integer	Minute steps.
stepSecond	1	Integer	Second steps.
minHour	0	Integer	Minimum boundary for hour selection.
maxHour	23	Integer	Maximum boundary for hour selection.
minMinute	0	Integer	Minimum boundary for minute selection.
maxMinute	59	Integer	Maximum boundary for hour selection.
minSecond	0	Integer	Minimum boundary for second selection.
maxSecond	59	Integer	Maximum boundary for second selection.
pagedate	null	Object	Initial date to display if value is null.
accesskey	null	String	Access key that when pressed transfers focus to the input element.
alt	null	String	Alternate textual description of the input field.
autocomplete	null	String	Controls browser autocomplete behavior.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
label	null	String	A localized user presentable name.
lang	null	String	Code describing the language used in the generated markup for this component.
maxlength	null	Integer	Maximum number of characters that may be entered in this field.
onblur	null	String	Client side callback to execute when input element loses focus.
onchange	null	String	Client side callback to execute when input element loses focus and its value has been modified since gaining focus.
onclick	null	String	Client side callback to execute onclick event.
ondblclick	null	String	Client side callback to execute when input element is double clicked.
onfocus	null	String	Client side callback to execute when input element receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over input element.
onkeypress	null	String	Client side callback to execute when a key is

			pressed and released over input element.
onkeyup	null	String	Client side callback to execute when a key is released over input element.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over input element
onmousemove	null	String	Client side callback to execute when a pointer button is moved within input element.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from input element.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto input element.
onmouseup	null	String	Client side callback to execute when a pointer button is released over input element.
onselect	null	String	Client side callback to execute when text within input element is selected by user.
placeholder	null	String	Specifies a short hint.
readonly	false	Boolean	Flag indicating that this component will prevent changes by the user.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
size	null	Integer	Number of characters used to determine the width of the input element.
tabindex	null	Integer	Position of the input element in the tabbing order.
title	null	String	Advisory tooltip information.
beforeShowDay	null	String	Client side callback to execute before displaying a date, used to customize date display.
mask	null	String	Applies a mask using the pattern.
timeControlType	slider	String	Defines the type of element to use for time picker, valid values are "slider" and "select".
beforeShow	null	String	Callback to execute before displaying calendar, element and calendar instance are passed as parameters
maskSlotChar	null	String	Placeholder in mask template.
maskAutoClear	true	Boolean	Clears the field on blur when incomplete input is entered

timeControlObject	null	String	Client side object to use in custom timeControlType.
timeInput	false	Boolean	Allows direct input in time field.
showHour	null	String	Whether to show the hour control.
showMinute	null	String	Whether to show the minute control.
showSecond	null	String	Whether to show the second control.
showMillisec	null	String	Whether to show the millisec control
showTodayButton	true	Boolean	Whether to show the "Current Date" button if showButtonPanel is rendered.
buttonTabIndex	null	String	Position of the button in the tabbing order.
inputStyle	null	String	Inline style of the input element. Used when mode is popup.
inputStyleClass	null	String	Style class of the input element. Used when mode is popup.

Getting Started with Calendar

Value of the calendar should be a `java.util.Date`.

Display Modes

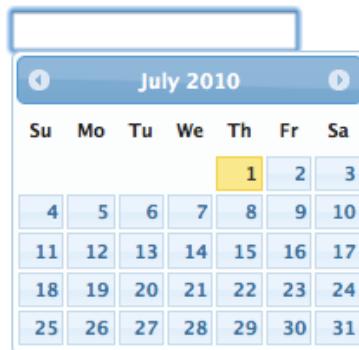

Calendar has two main display modes, *popup* (default) and *inline*.

Inline

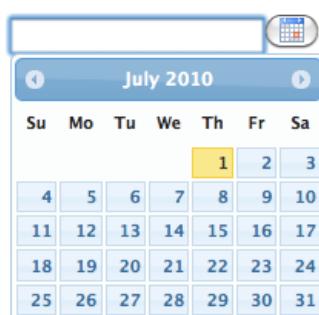

Popup

showOn option defines the client side event to display the calendar. Valid values are;

- focus: When input field receives focus
- button: When popup button is clicked
- both: Both *focus* and *button* cases

Popup Button

Popup Icon Only

Paging

Calendar can also be rendered in multiple pages. See the [Example](#).

To override calculated pattern from locale, use the pattern option;

`dd.MM.yyyy`

`06.07.2010`

`yy, M, d`

`10, 7, 13`

`EEE, dd MMM, yyyy`

`Fri, 23 Jul, 2010`

Effects

Various effects can be used when showing and hiding the popup calendar, options are; show, slideDown, fadeIn, blind, bounce, clip, drop, fold and slide.

Ajax Behavior Events

Calendar provides a `dateSelect` ajax behavior event to execute an instant ajax selection whenever a date is selected. If you define a method as a listener, it will be invoked by passing an `org.primefaces.event.SelectEvent` instance.

" " " " "

In popup mode, calendar also supports regular ajax behavior events like blur, keyup and more.

Another handy event is the `viewChange` that is fired when month and year changes. An instance of `org.primefaces.event.DateViewChangeEvent` is passed to the event listener providing the current month and year information.

Date Ranges

Using `mindate` and `maxdate` options, selectable dates can be restricted. Values for these attributes can either be a string or a `java.util.Date`.

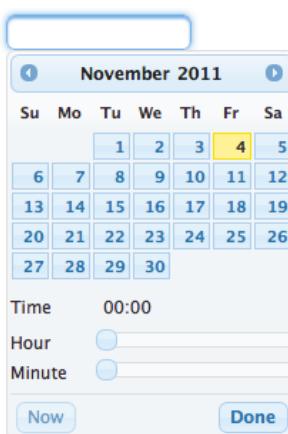

Navigator

Navigator is an easy way to jump between months/years quickly.

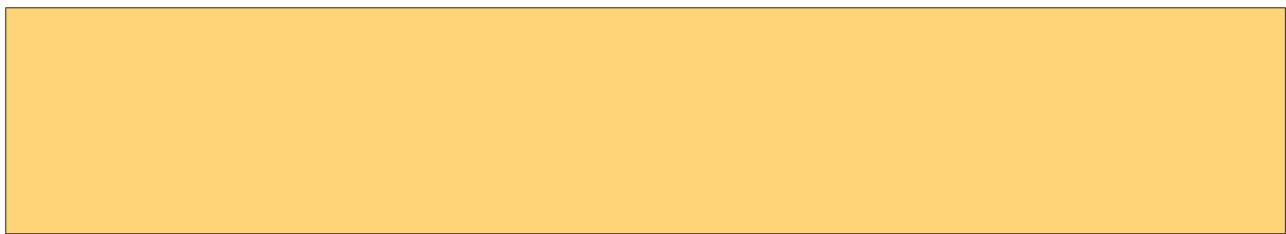

TimePicker

TimePicker functionality is enabled by adding time format to your pattern.

Advanced Customization

Use beforeShowDay javascript callback to customize the look of each date. The function returns an array with two values, first one is flag to indicate if date would be displayed as enabled and second parameter is the optional style class to add to date cell. Following example disabled tuesdays and fridays.

Mask

Calendar has a built-in mask feature similar to the InputMask component. Set *mask* option to true to enable mask support.

Client Side API

Widget: *PrimeFaces.widget.Calendar*

getDate()	-	Date	Return selected date
setDate(date)	date: Date to display	void	Sets display date
disable()	-	void	Disables calendar
enable()	-	void	Enables calendar

Skinning

Calendar resides in a container element which *style* and *styleClass* options apply.

Following is the list of structural style classes;

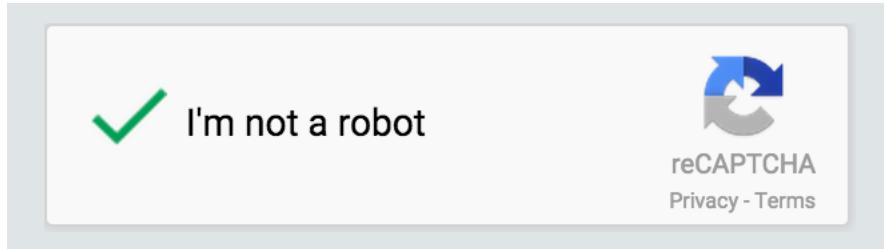

.ui-datepicker	Main container
.ui-datepicker-header	Header container
.ui-datepicker-prev	Previous month navigator
.ui-datepicker-next	Next month navigator
.ui-datepicker-title	Title
.ui-datepicker-month	Month display
.ui-datepicker-table	Date table
.ui-datepicker-week-end	Label of weekends
.ui-datepicker-other-month	Dates belonging to other months
.ui-datepicker td	Each cell date
.ui-datepicker-buttonpane	Button panel
.ui-datepicker-current	Today button

.ui-datepicker-close	Close button

As skinning style classes are global, see the main theming section for more information.

3.12 Captcha

Captcha is a form validation component based on Recaptcha API V2.

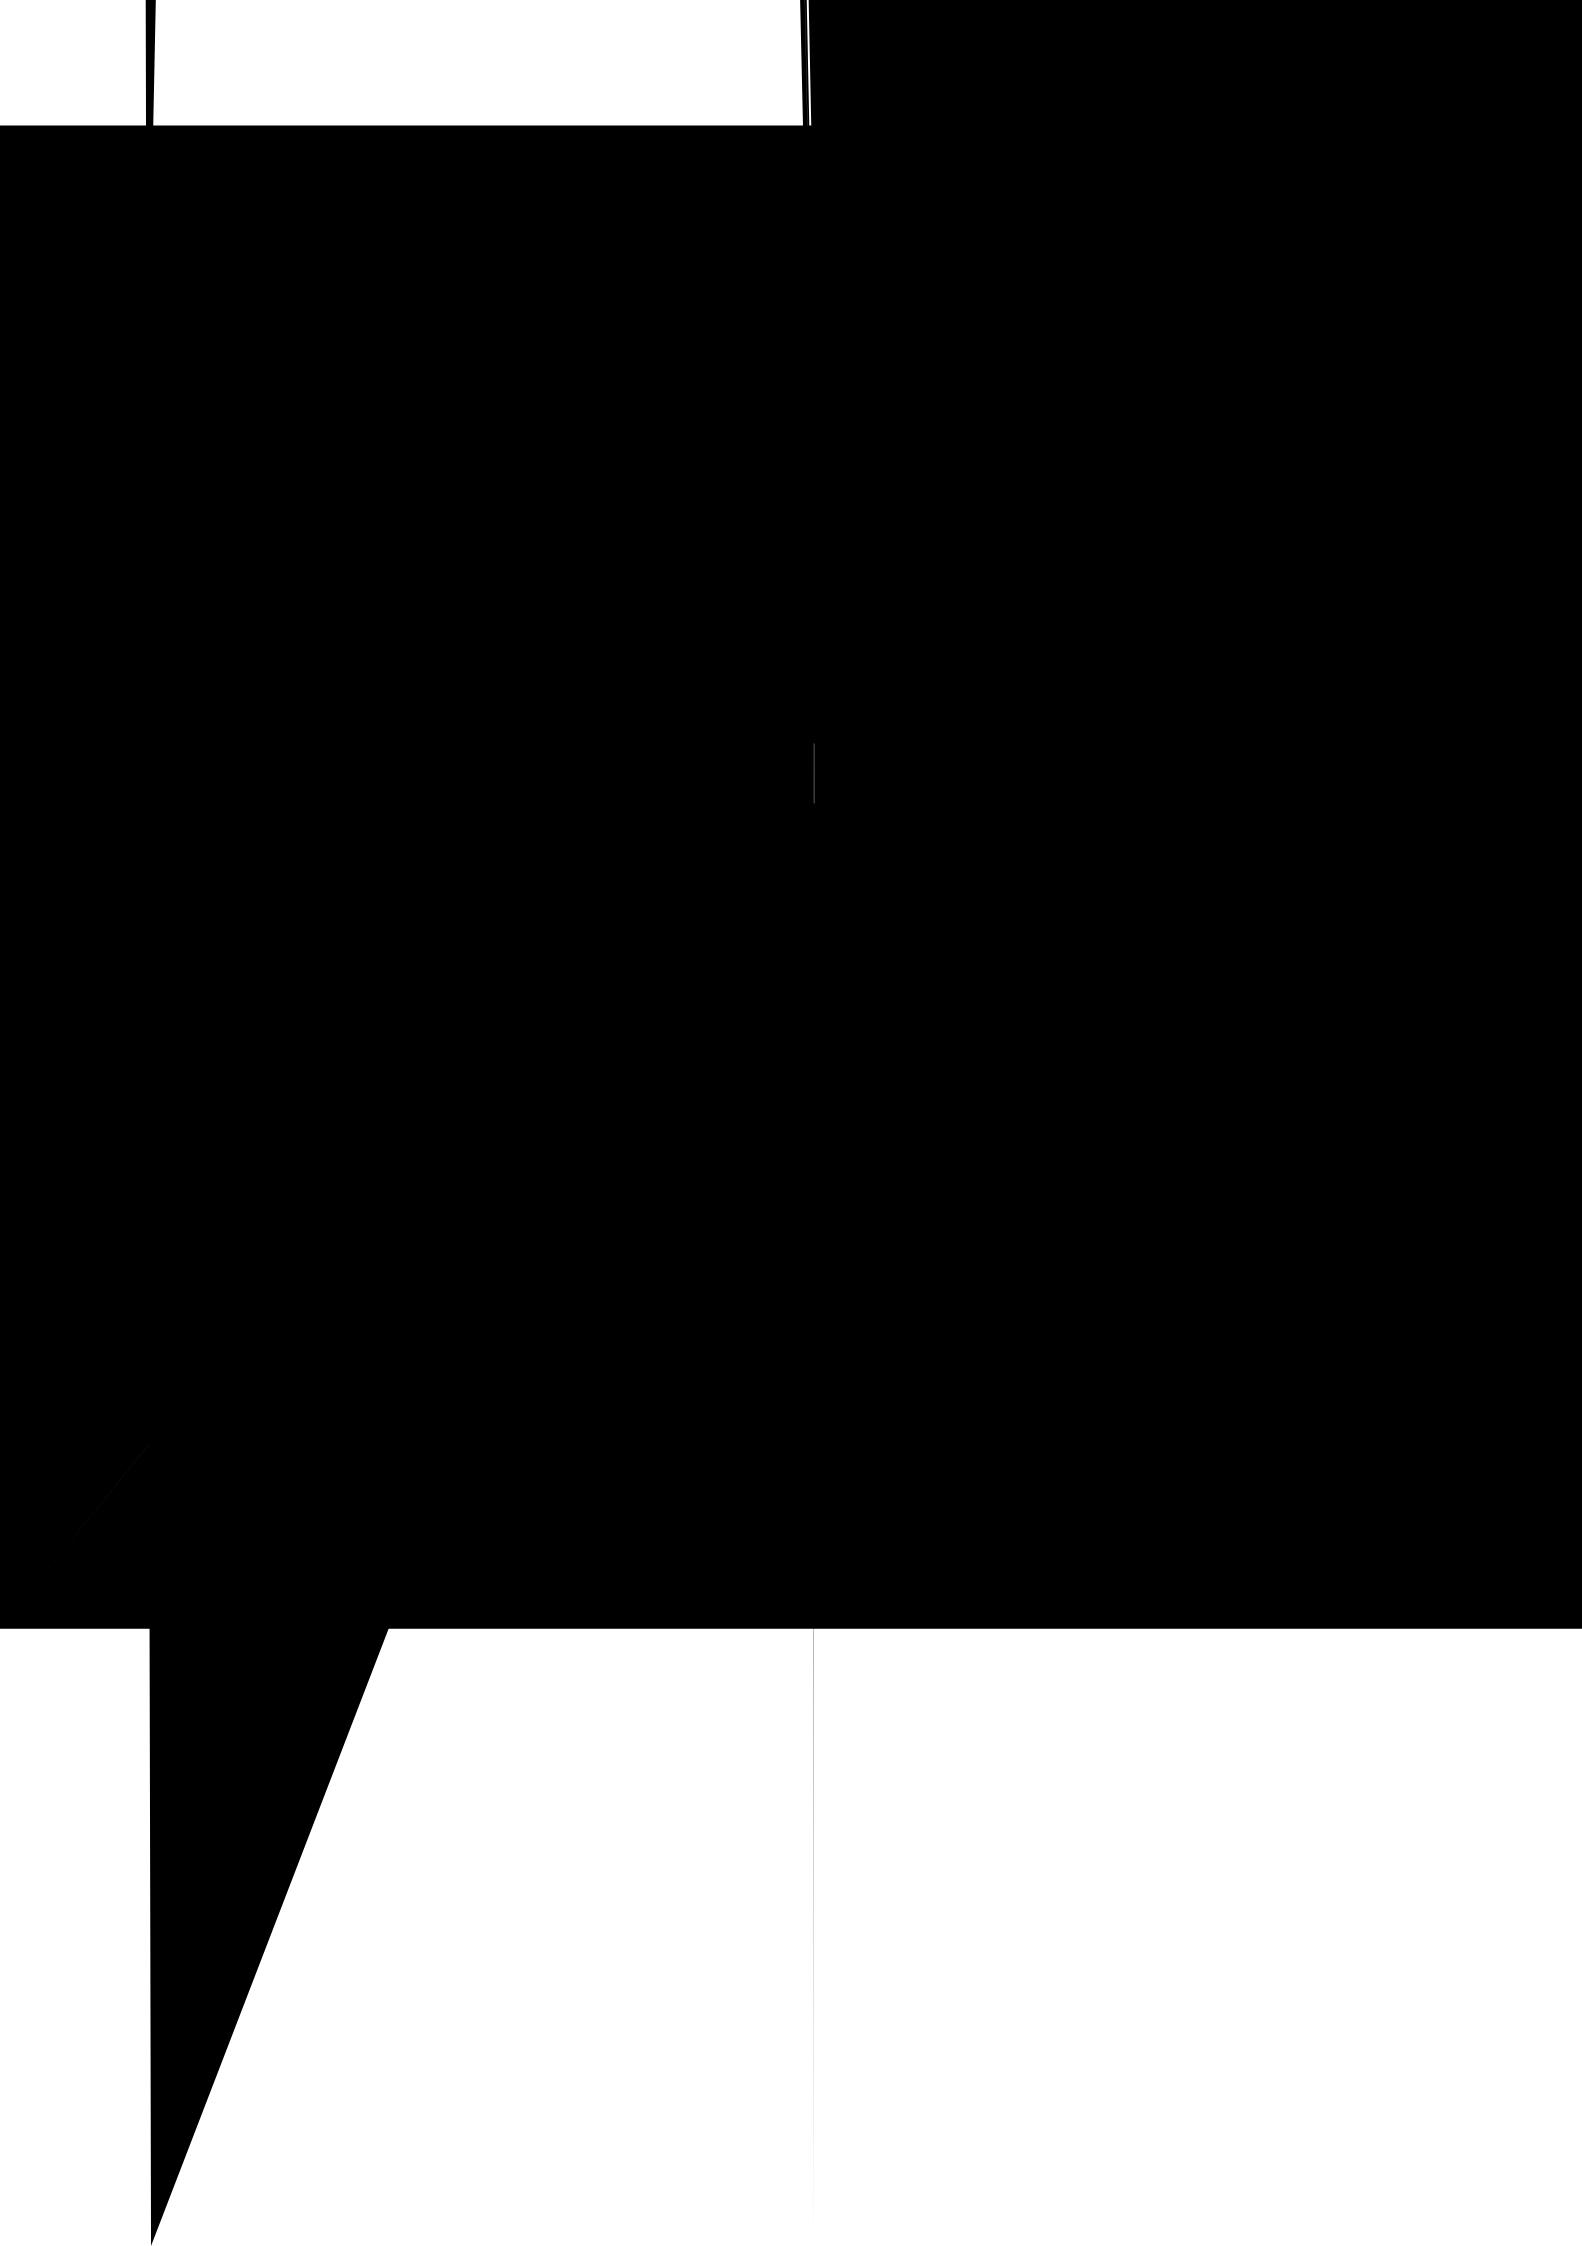

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
value	null	Object	Value of the component than can be either an EL expression of a literal text.
converter	null	Converter/String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id.
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required.
validator	null	MethodExpr	A method binding expression that refers to a

Languages

Text instructions displayed on captcha is customized with the *language* attribute. Below is a captcha with Turkish text.

Overriding Validation Messages

By default captcha displays it's own validation messages, this can be easily overridden by the JSF message bundle mechanism. Corresponding keys are;

Summary	primefaces.captcha.INVALID
Detail	primefaces.captcha.INVALID_detail

Tips

- Use *label* option to provide readable error messages in case validation fails.
- Enable *secure* option to support https otherwise browsers will give warnings.
- See <http://www.google.com/recaptcha/learnmore> to learn more about how reCaptcha works.

3.13 Carousel

Carousel is a multi purpose component to display a set of data or general content with slide effects.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

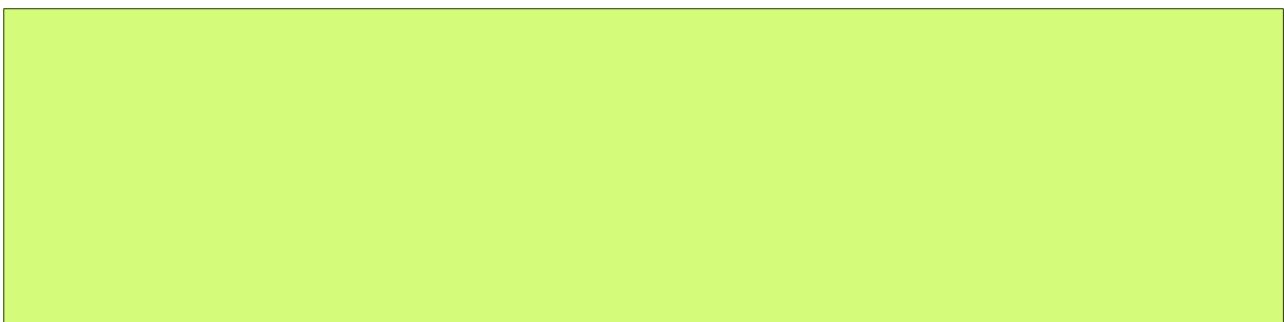

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	A value expression that refers to a collection
var	null	String	Name of the request scoped iterator
numVisible	3	Integer	Number of visible items per page
firstVisible	0	Integer	Index of the first element to be displayed
widgetVar	null	String	Name of the client side widget.
circular	false	Boolean	Sets continuous scrolling
vertical	false	Boolean	Sets vertical scrolling
autoPlayInterval	0	Integer	Sets the time in milliseconds to have Carousel start

			scrolling automatically after being initialized
pageLinks	3	Integer	Defines the number of page links of paginator.
effect	slide	String	Name of the animation, could be “fade” or “slide”.
easing	easeInOutCirc	String	Name of the easing animation.
effectDuration	500	Integer	Duration of the animation in milliseconds.
dropdownTemplate.	{page}	String	Template string for dropdown of paginator.
style	null	String	Inline style of the component..
styleClass	null	String	Style class of the component..
itemStyle	null	String	Inline style of each item.
itemStyleClass	null	String	Style class of each item.
headerText	null	String	Label for header.
footerText	null	String	Label for footer.
responsive	false	Boolean	In responsive mode, carousel adjusts its content based on screen size.
breakpoint	560	Integer	Breakpoint value in pixels to switch between small and large viewport.

Getting Started with Carousel

Carousel has two main use-cases; data and general content display. To begin with data iteration let's use a list of cars to display with carousel.

Carousel iterates through the cars collection and renders it

- easeNone
- easeOut
- easeInOutCirc
- easeOutStrong
- elasticBoth
- elasticIn
- elasticOut

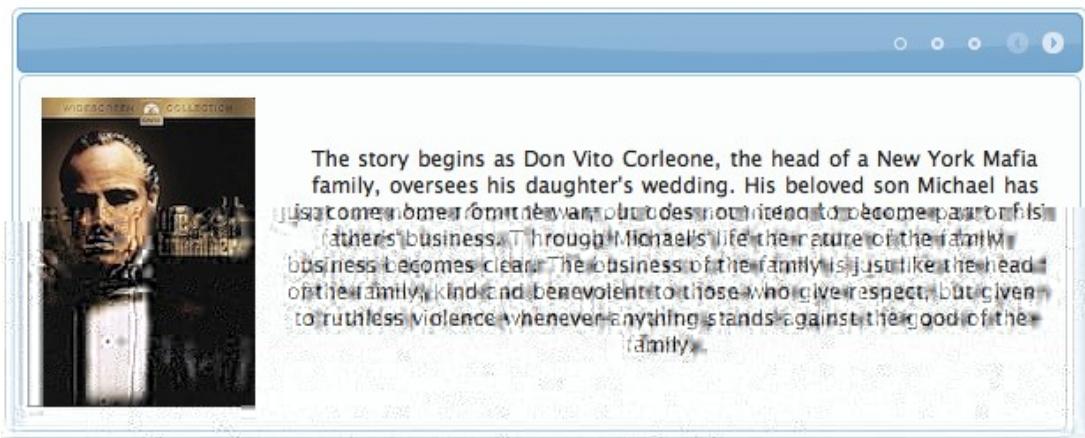

SlideShow

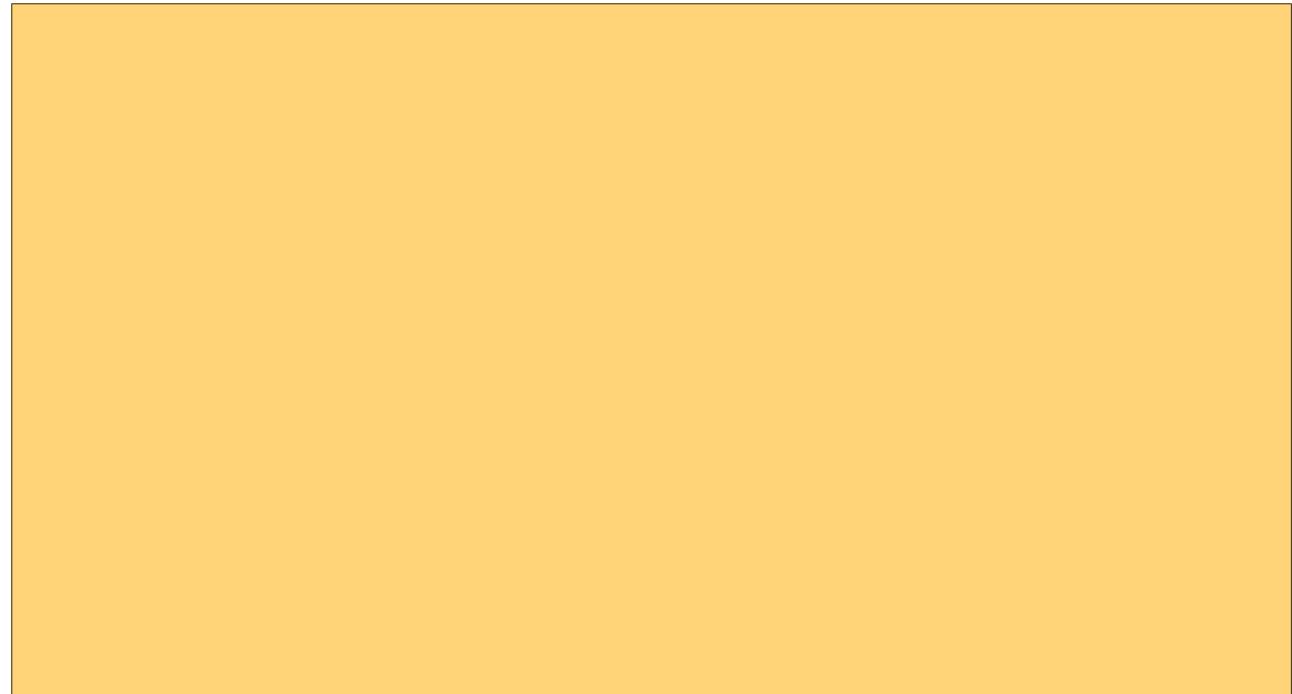

Carousel can display the contents in a slideshow, for this purpose *autoPlayInterval* and *circular* attributes are used. Following carousel displays a collection of images as a slideshow.

Content Display

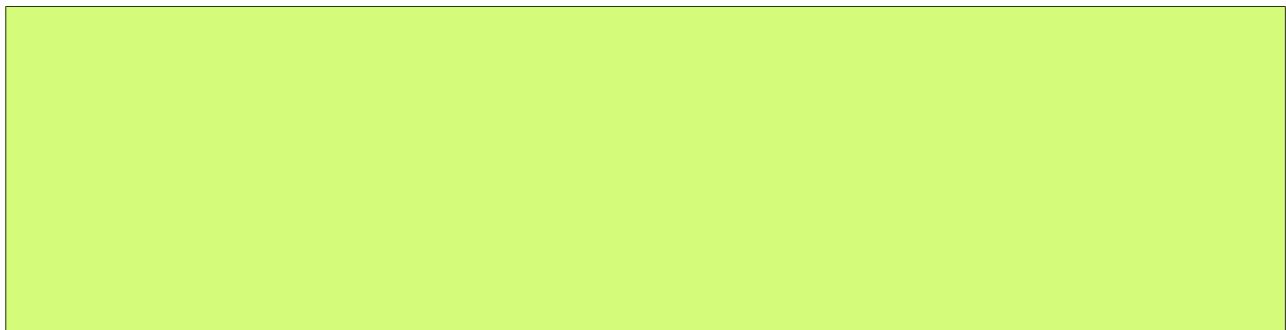

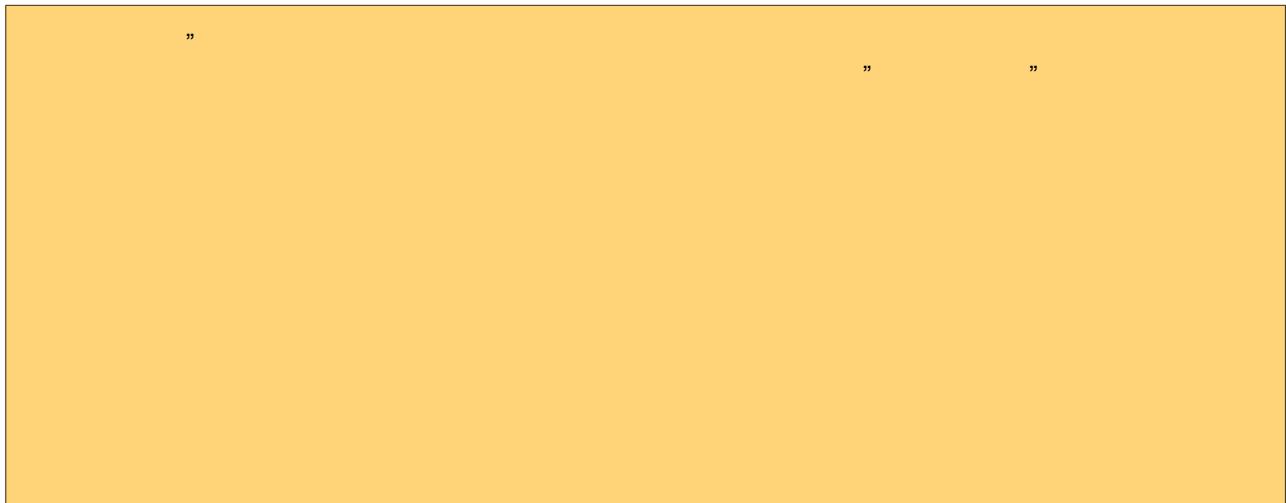

Another use case of carousel is tab based content display.

Item Selection

Sample below selects an item from the carousel and displays details within a dialog.

Header and Footer

Header and Footer of carousel can be defined in two ways either, using *headerText* and *footerText* options that take simple strings as labels or by *header* and *footer* facets that can take any custom content.

Responsive

When responsive mode is enabled via setting responsive option to true, carousel switches between small and large viewport depending on the breakpoint value which is 560 by default.

Client Side API

Widget: *PrimeFaces.widget.Carousel*

next()	-	void	Displays next page.
prev()	-	void	Displays previous page.
setPage()	index	void	Displays page with given index.
startAutoplay()	-	void	Starts slideshow.
stopAutoplay()	-	void	Stops slideshow.

Skinning

Carousel resides in a container element which *style* and *styleClass* options apply. *itemStyle* and *itemStyleClass* attributes apply to each item displayed by carousel. Following is the list of structural style classes;

.ui-carousel	Main container
.ui-carousel-header	Header container
.ui-carousel-header-title	Header content
.ui-carousel-viewport	Content container
.ui-carousel-button	Navigation buttons
.ui-carousel-next-button	Next navigation button of paginator
.ui-carousel-prev-button	Prev navigation button of paginator
.ui-carousel-page-links	Page links of paginator.
.ui-carousel-page-link	Each page link of paginator.
.ui-carousel-item	Each item.

As skinning style classes are global, see the main theming section for more information.

3.14 CellEditor

CellEditor is a helper component of datatable used for incell editing.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean

Getting Started with CellEditor

See inline editing section in datatable documentation for more information about usage.

3.15 Chart

Chart component is a generic graph component to create various types of charts using jqplot library. Each chart type has its own subsection with code examples and section 3.12.10 documents the full charting API.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

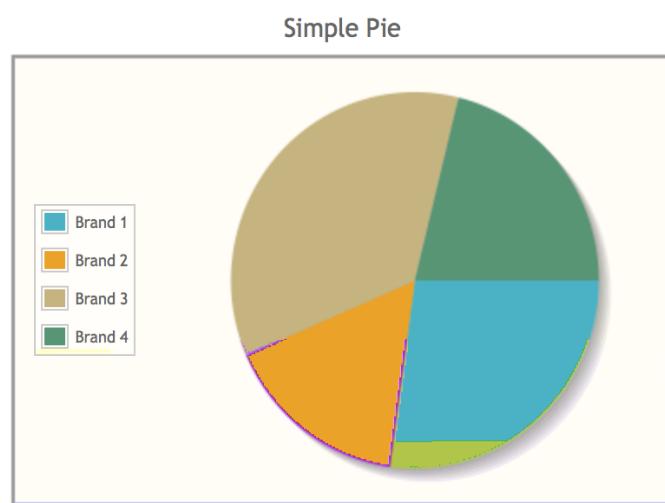

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
type	null	String	Type of the chart.
model	null	ChartModel	Model object of data and settings.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
widgetVar	null	String	Name of the client side widget.
responsive	false	Boolean	In responsive mode, chart is redrawn when window is resized.

3.15.1 PieChart

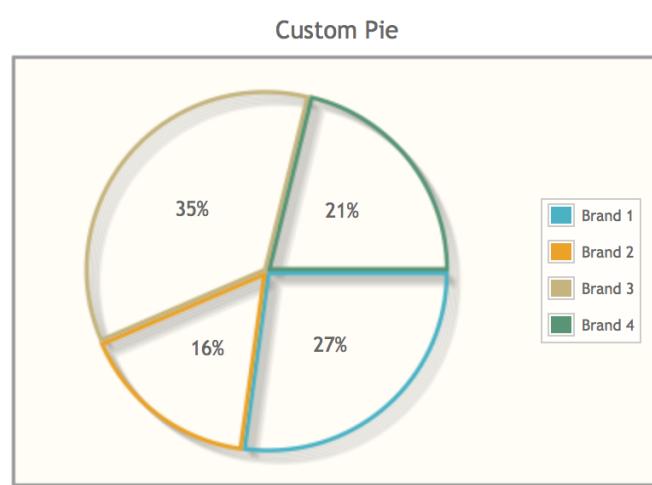

PieChart is created with PieChartModel.

Basic

Customized

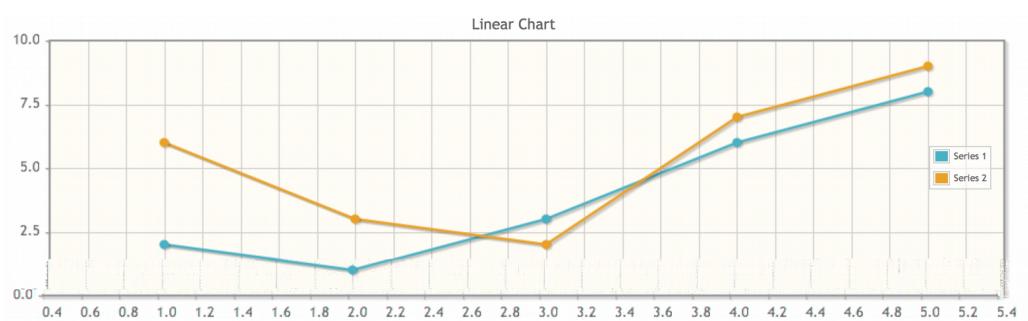

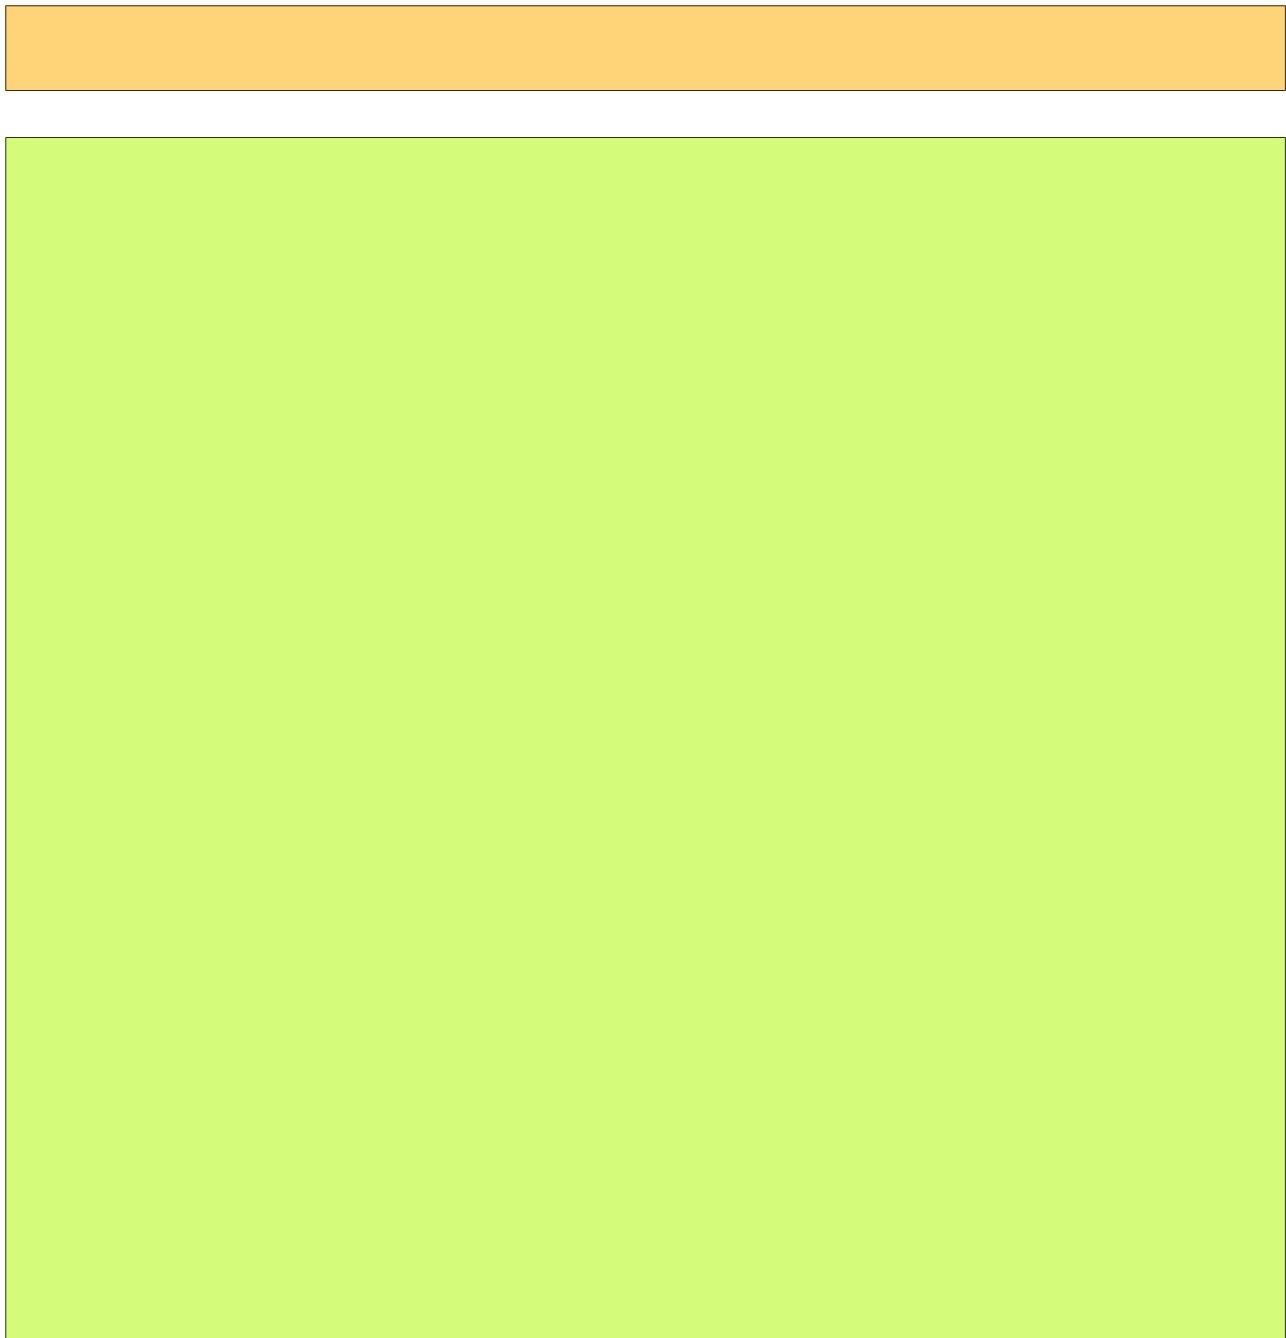

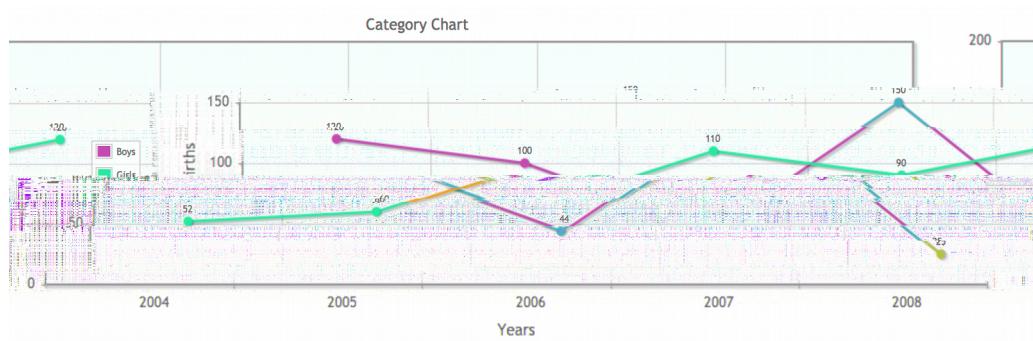

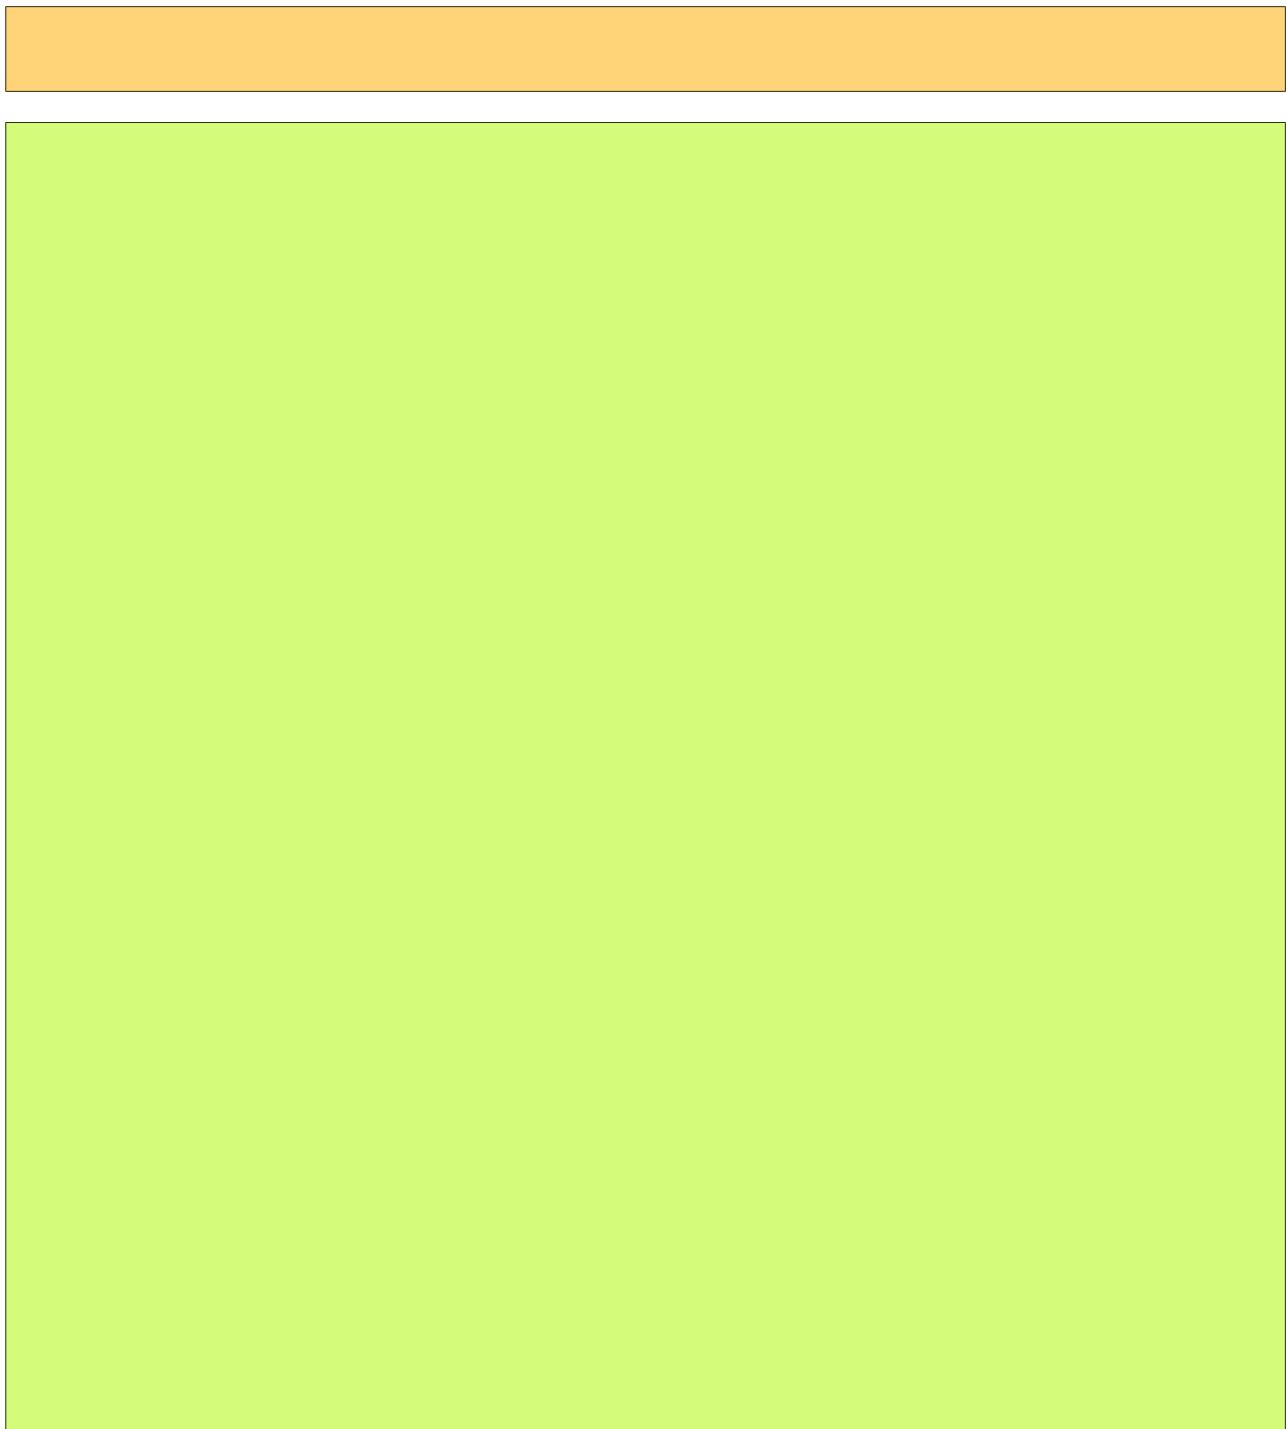

3.15.2 LineChart

LineChartModel is used to create a line chart.

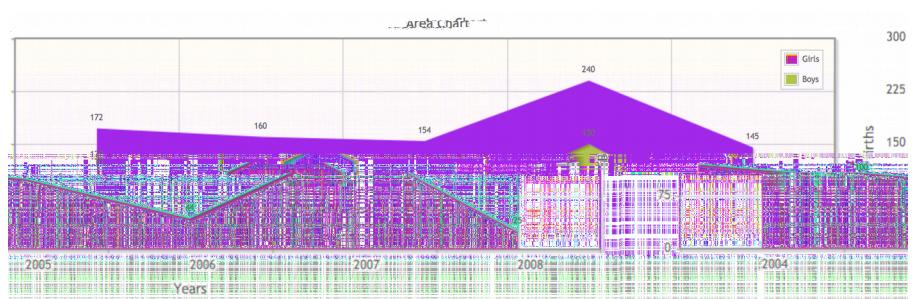

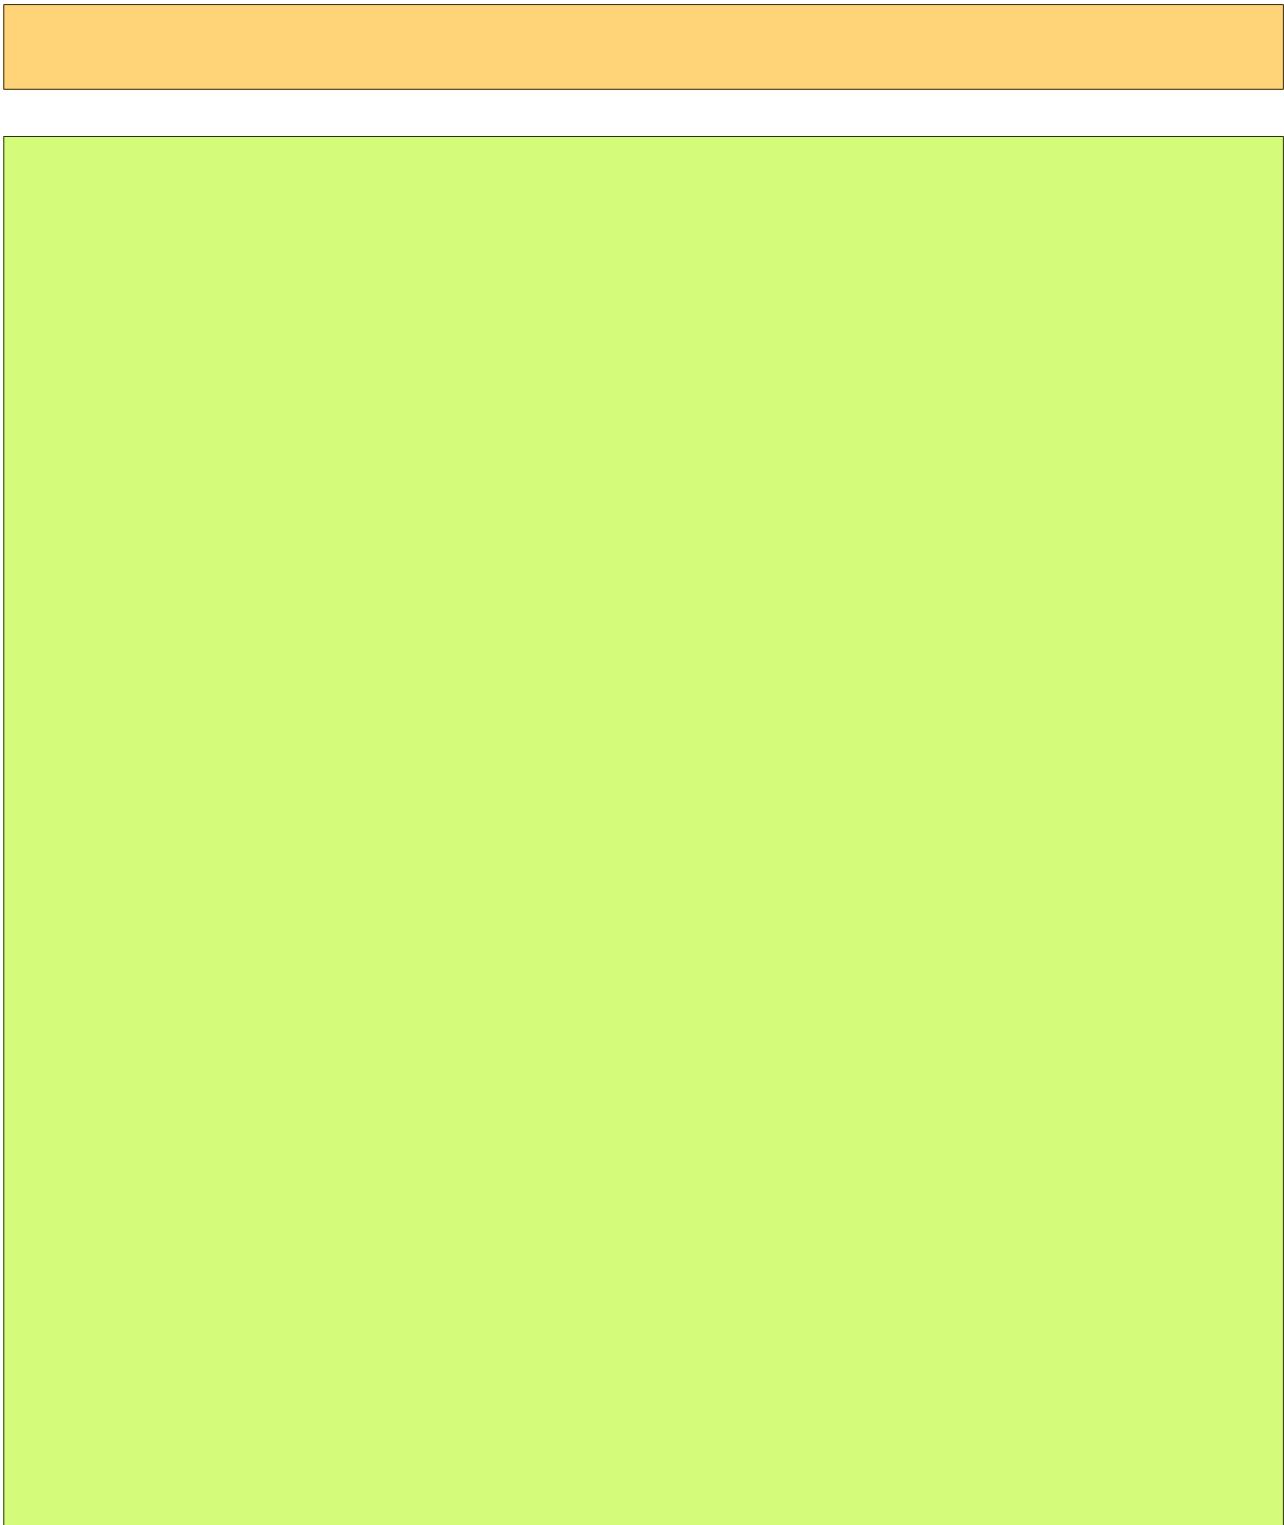

Basic

Customized

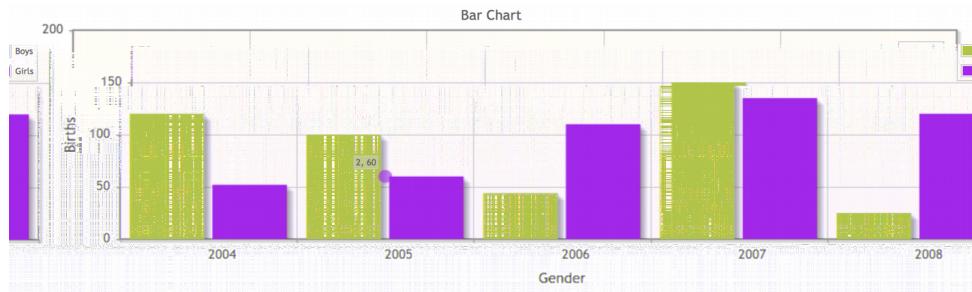

Area

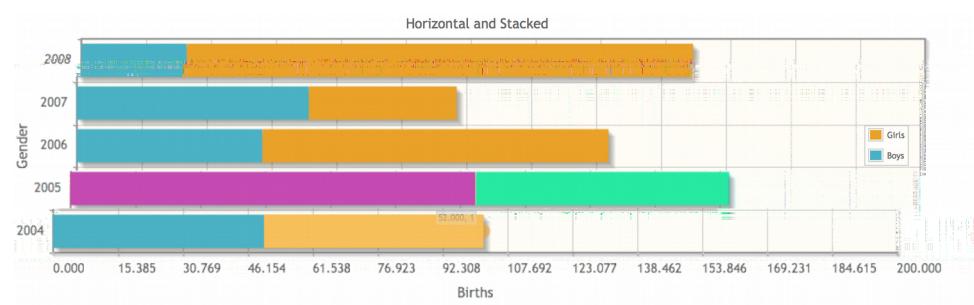

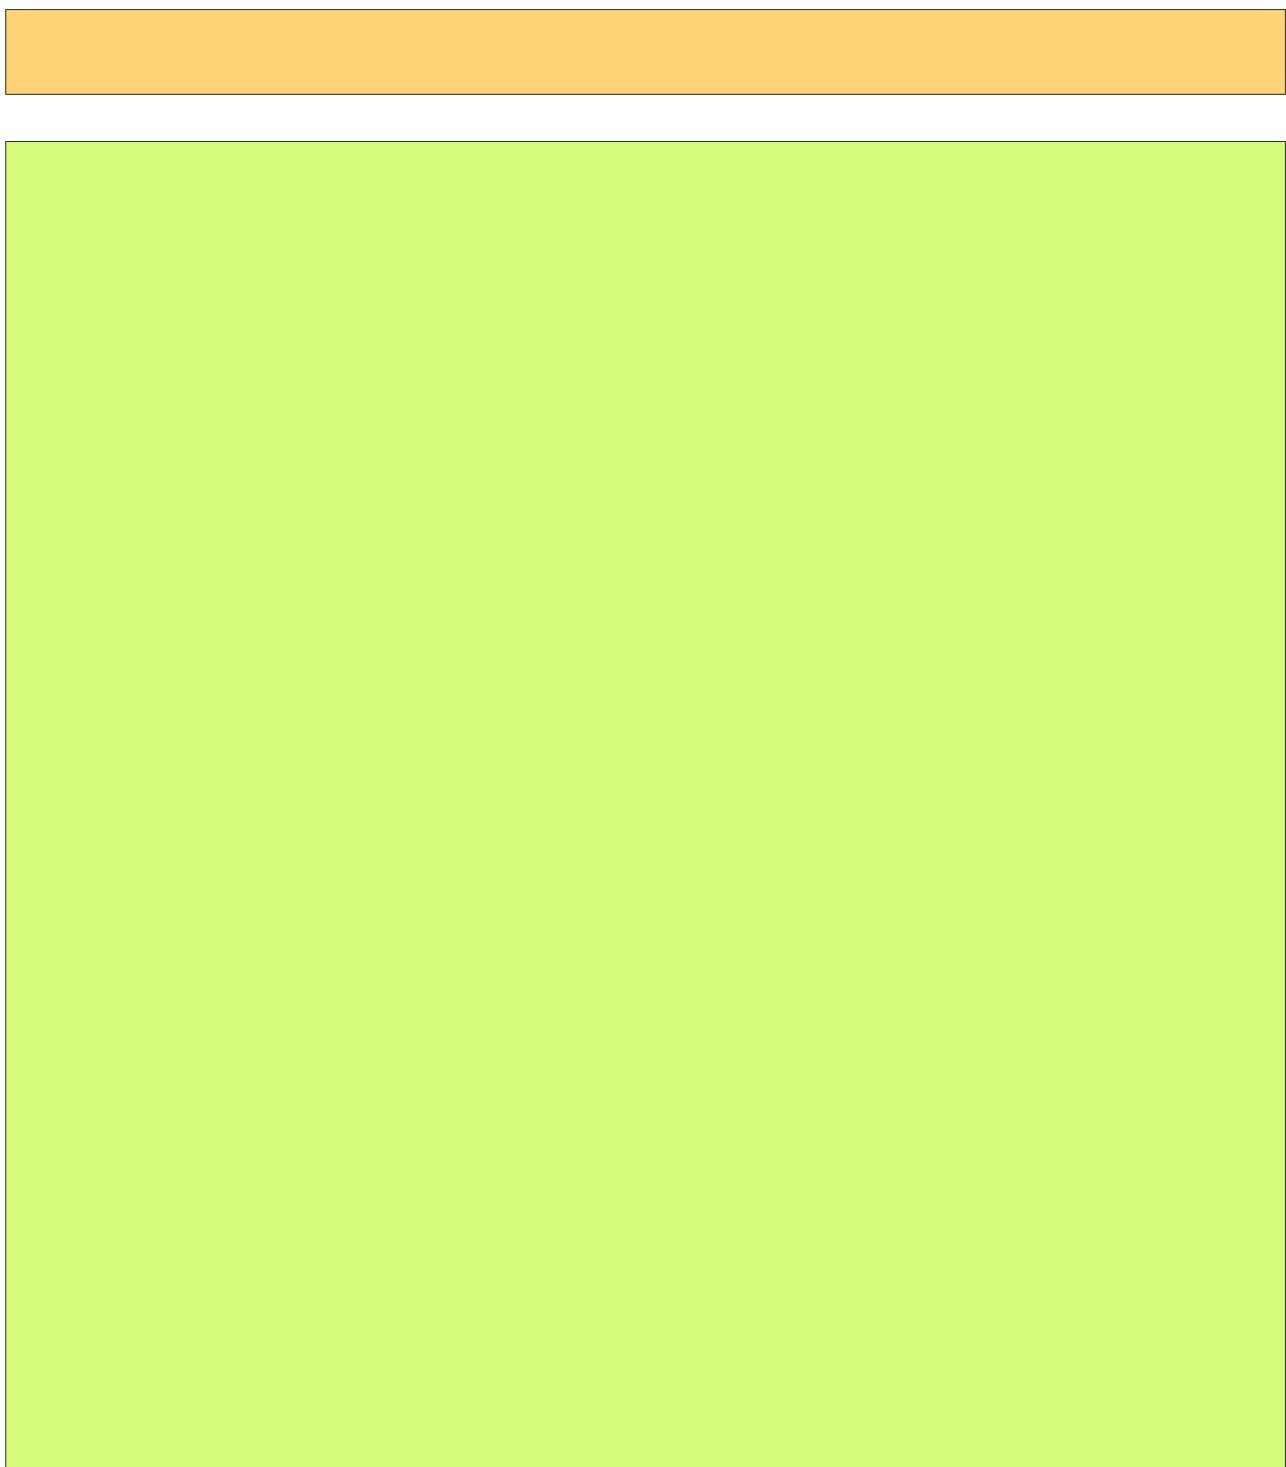

3.15.3 BarChart

BarChartModel is used to created a BarChart.

Basic

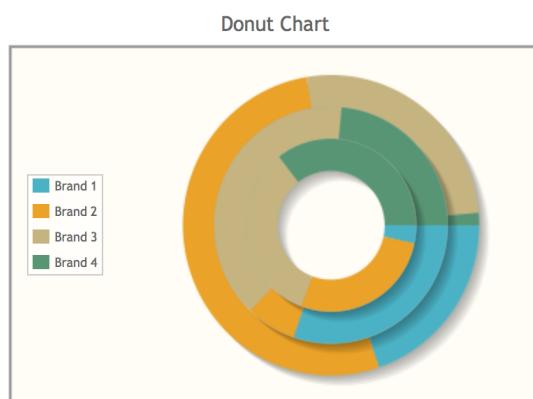

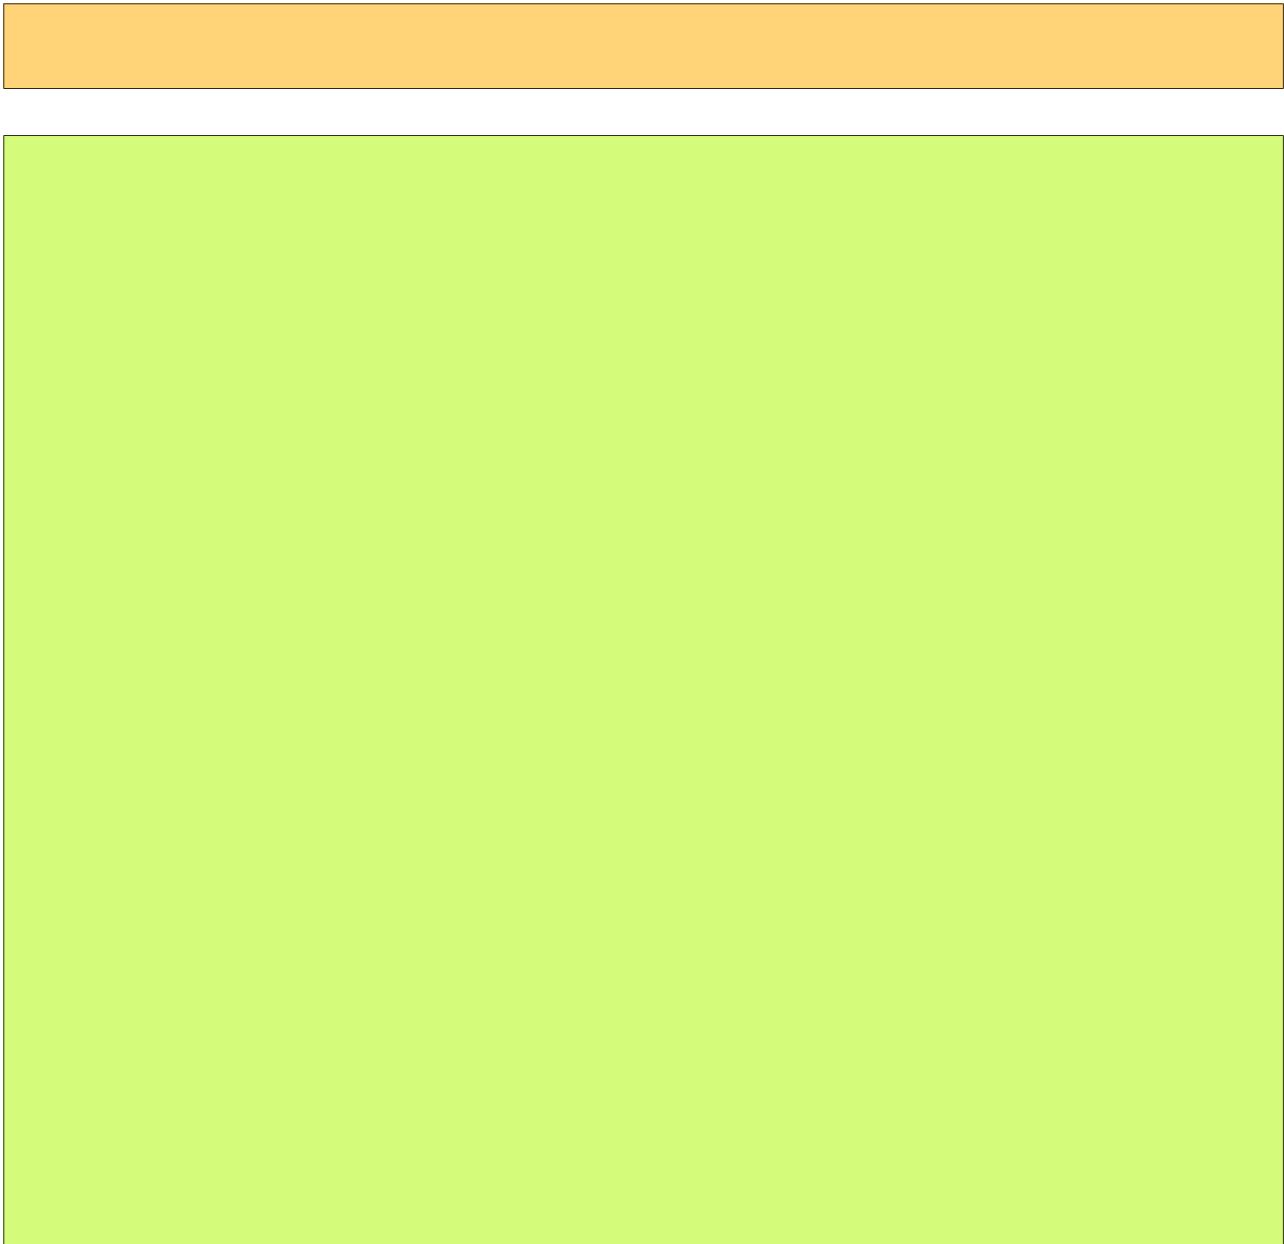

Horizontal and Stacked

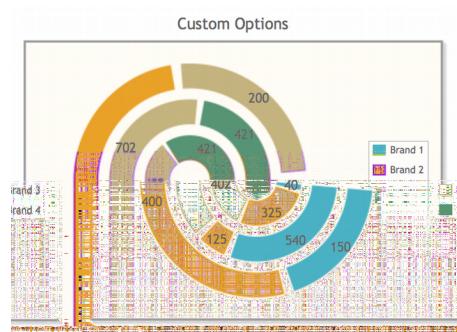

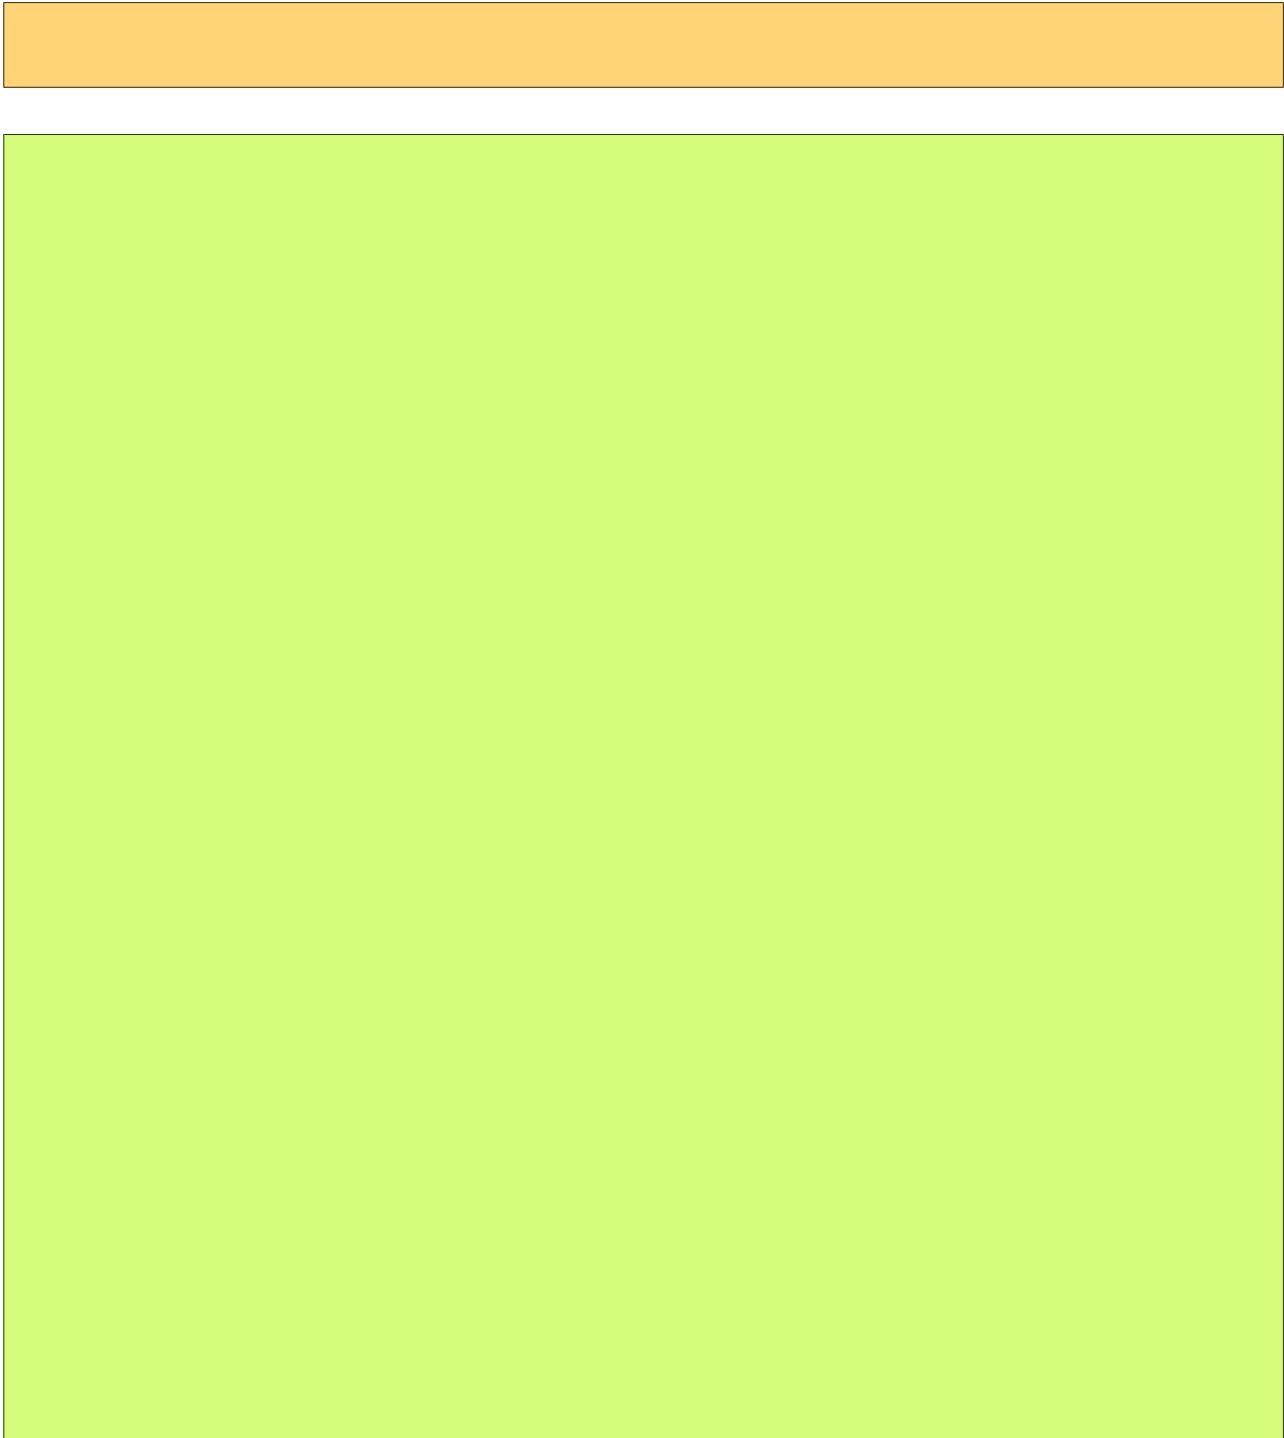

3.15.4 DonutChart

DonutChart is generated using DonutChartModel.

Basic

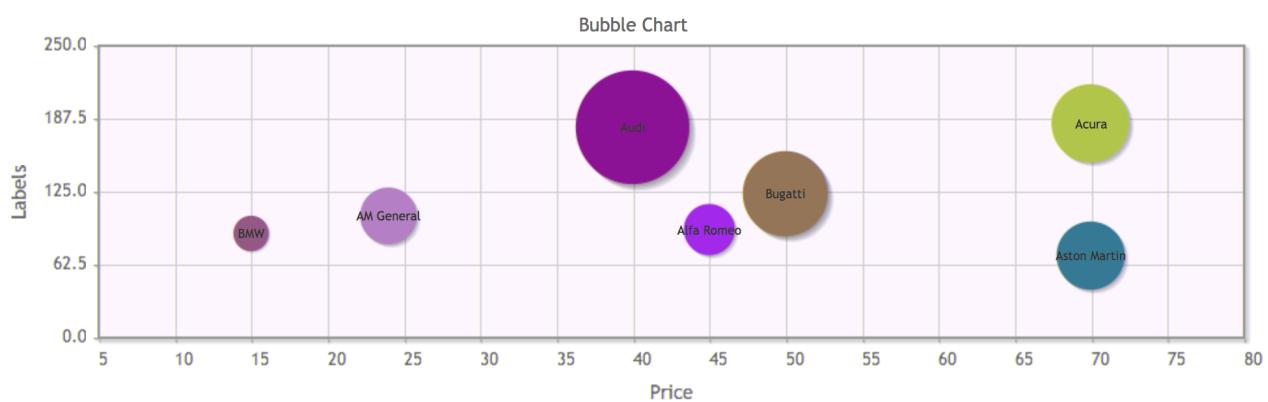

Customized

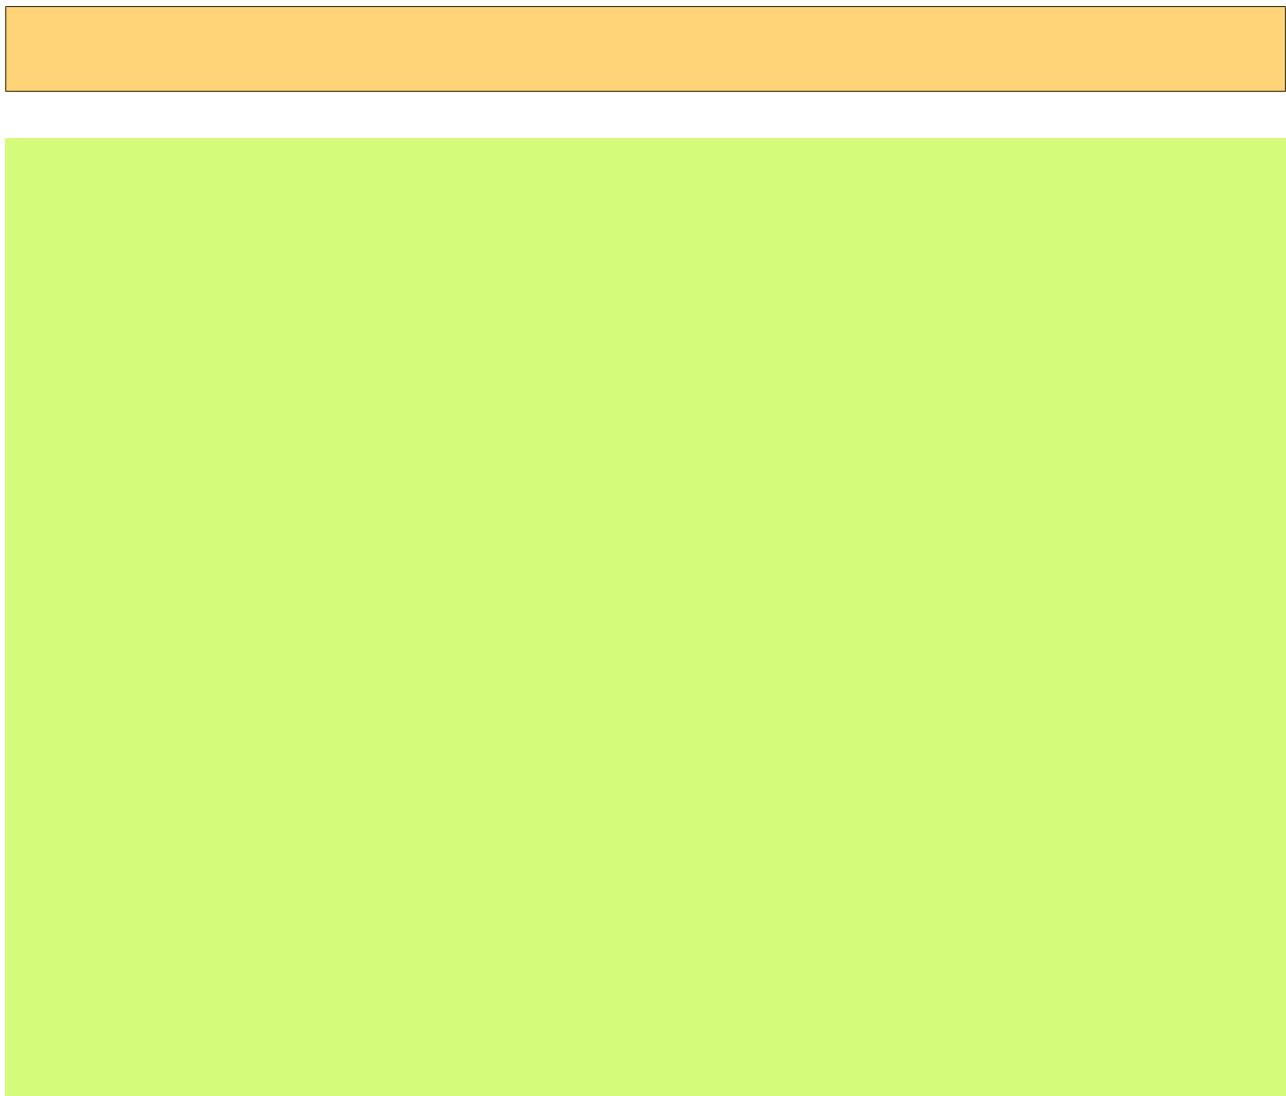

3.15.5 BubbleChart

BubbleChart is created with a BubbleChartModel.

Basic

Customized

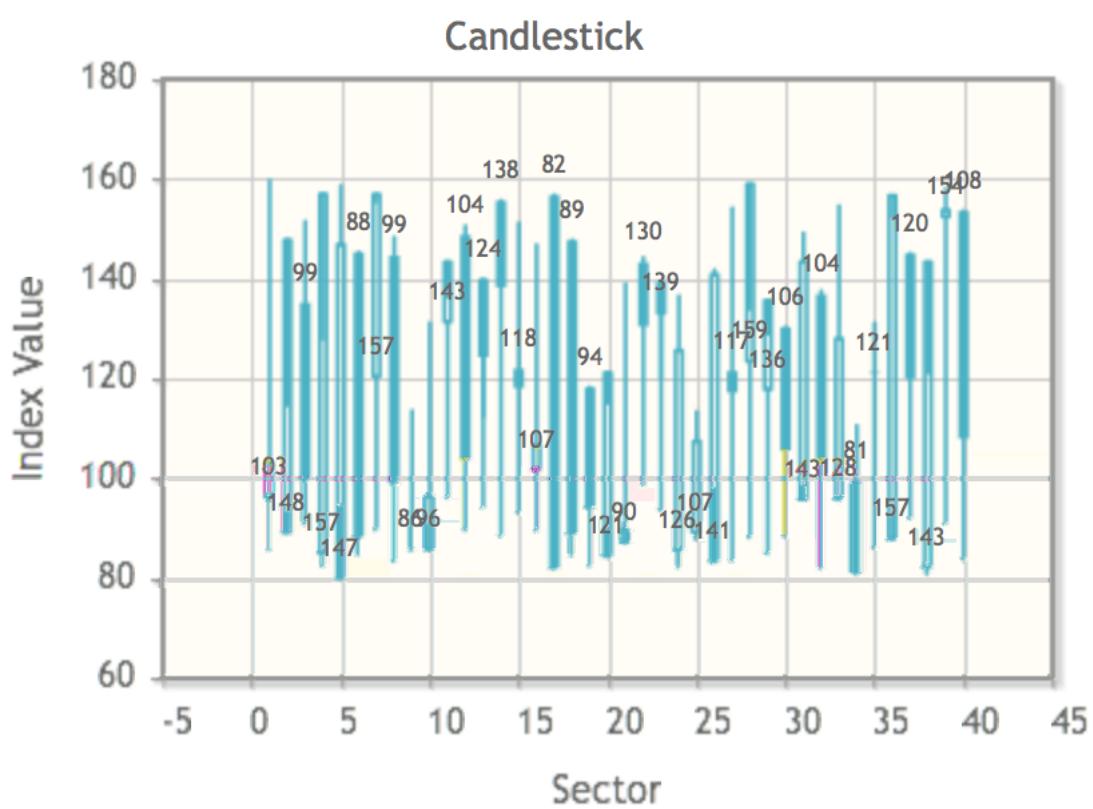

3.15.6 Ohlc Chart

OhlcChartModel is used to display Ohlc Charts.

Basic

Candlestick

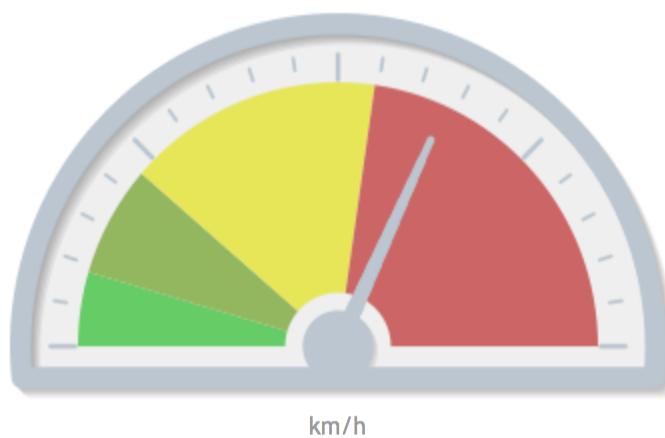

3.15.7 MeterGauge Chart

MeterGauge Chart is created using MeterGaugeChartModel.

Basic

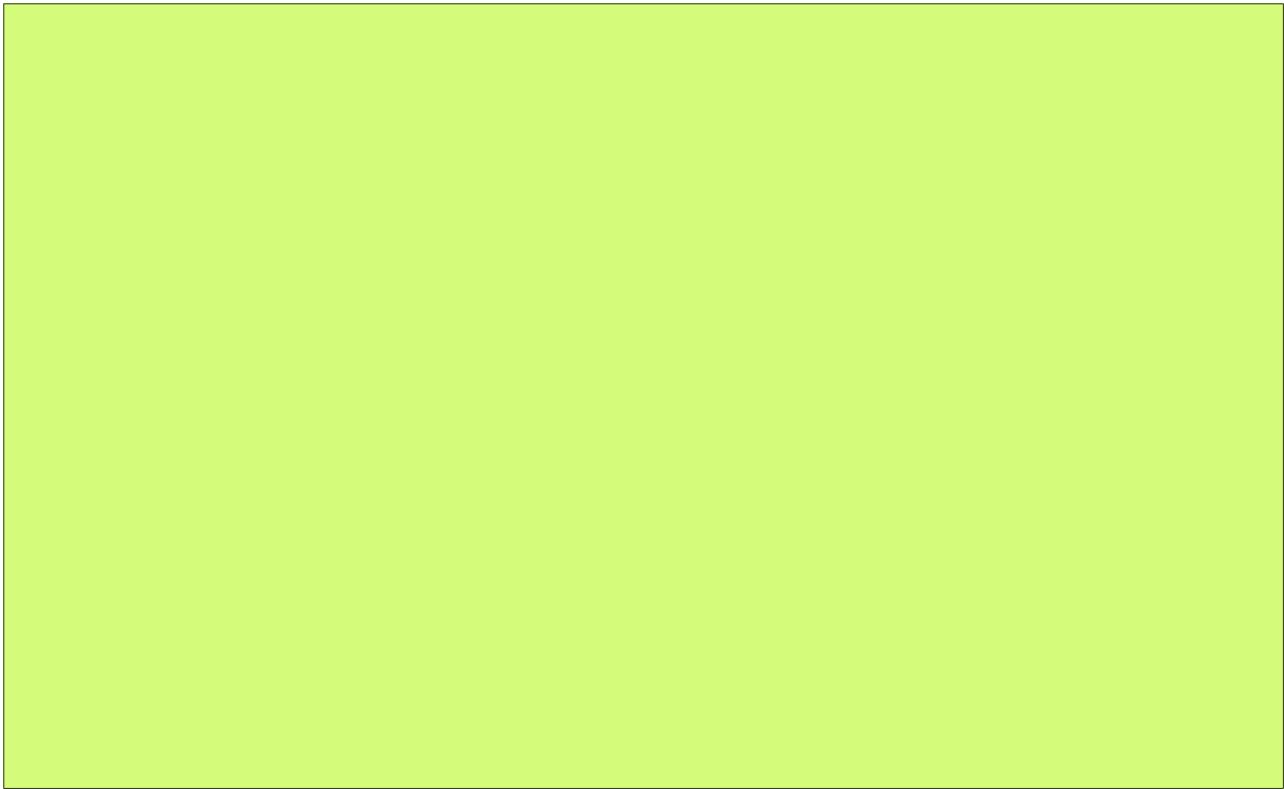

Custom Options

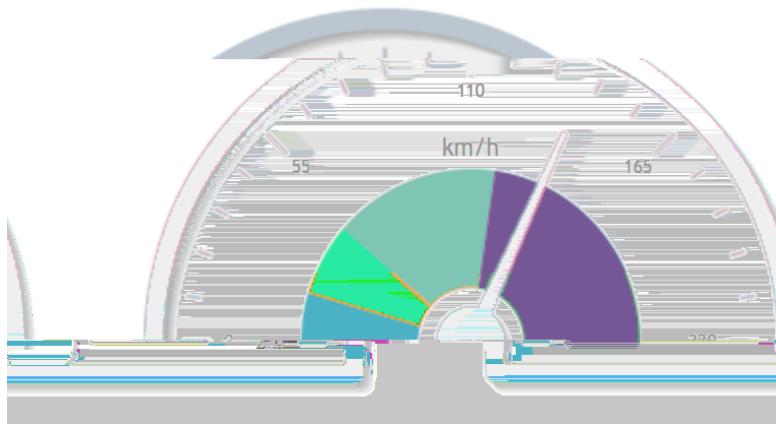

Customized

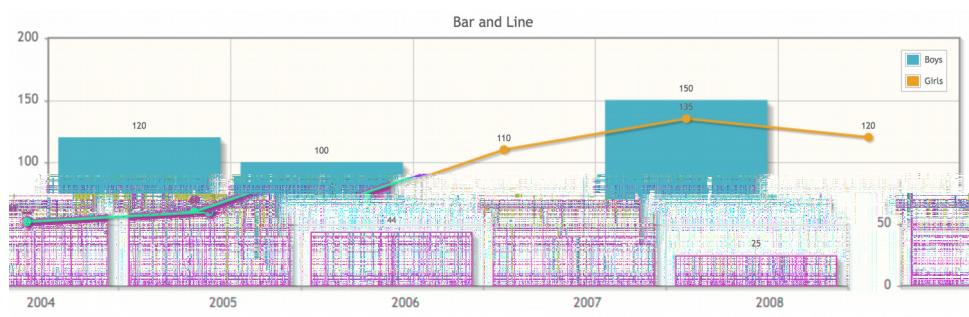

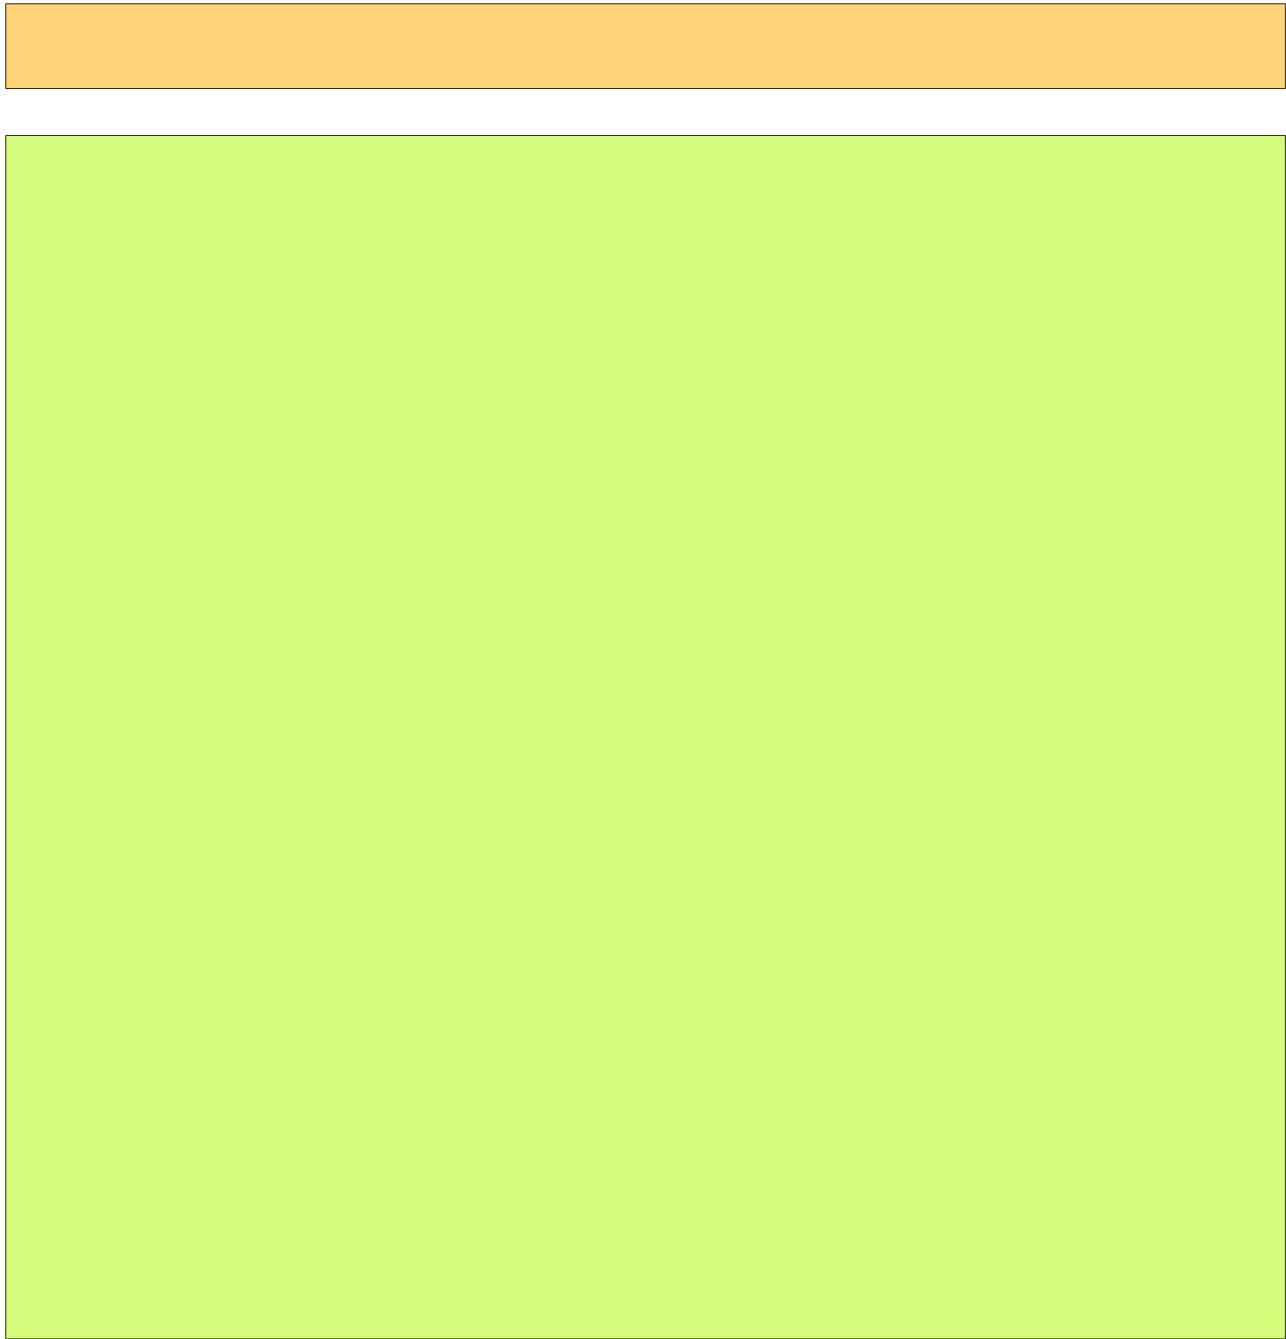

MeterGauge Chart

3.15.8 Combined Chart

On same graph, different series type can be displayed together.

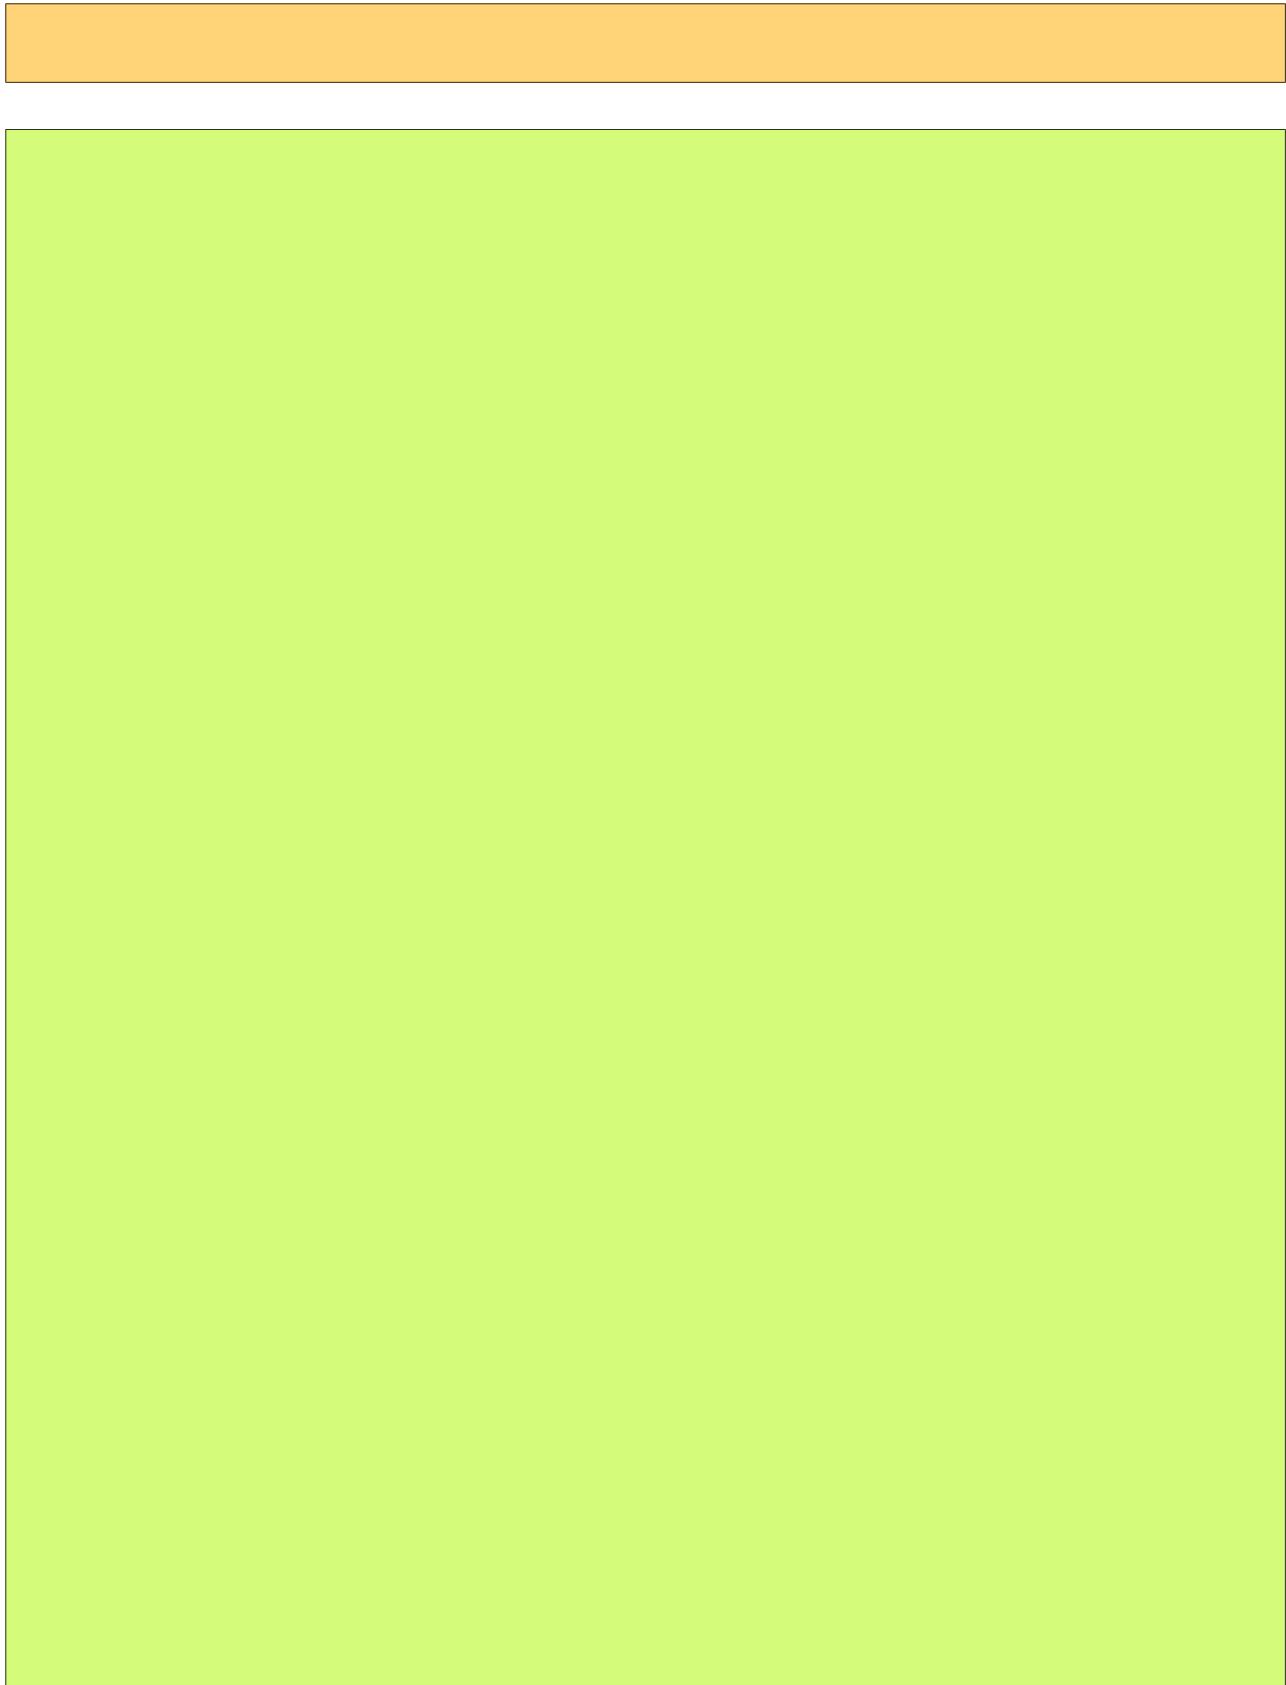

Basic

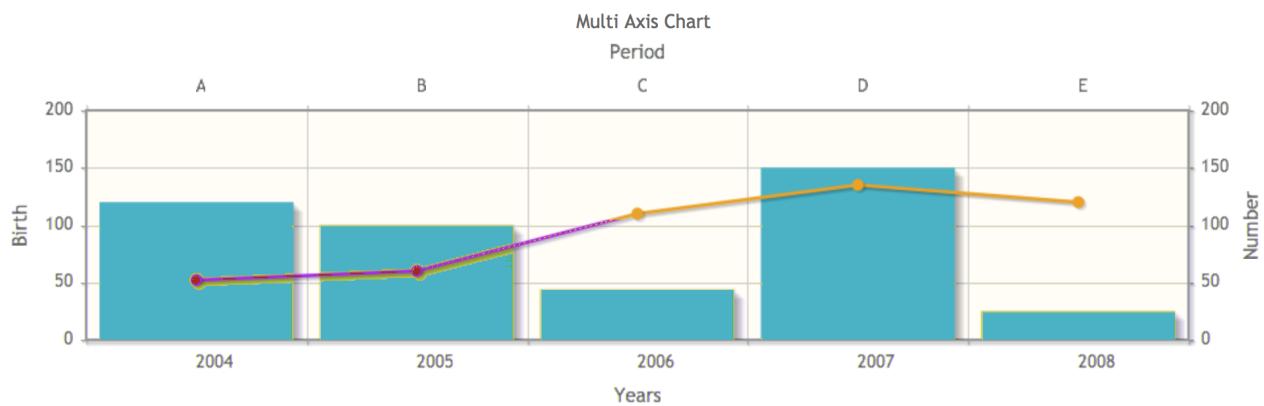

3.15.9 Multiple Axis

Up to 9 axes (xaxis-x9axis, yaxis-y9axis) can be displayed on the same chart.

Basic

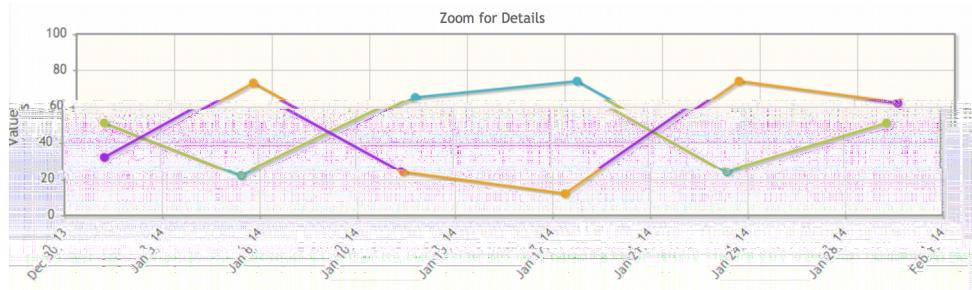

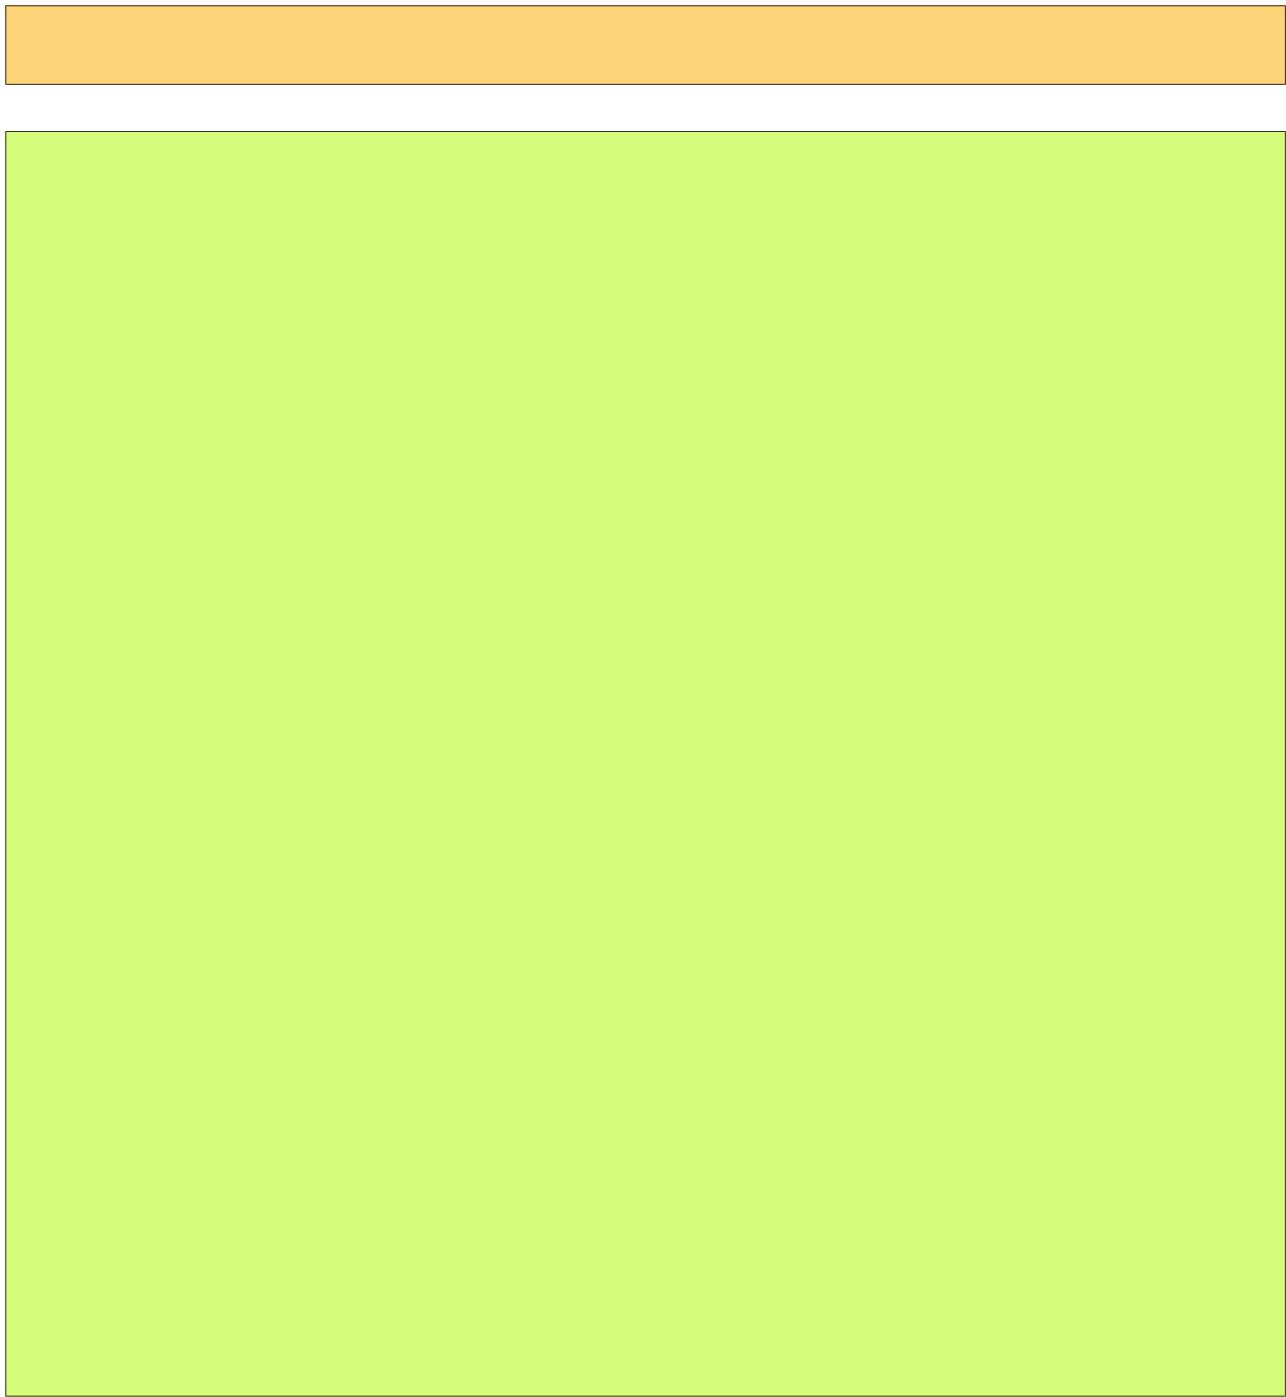

3.15.10 Date Axis

Use DateAxis if you are displaying dates in an axis.

Basic

3.15.11 Interactive Chart

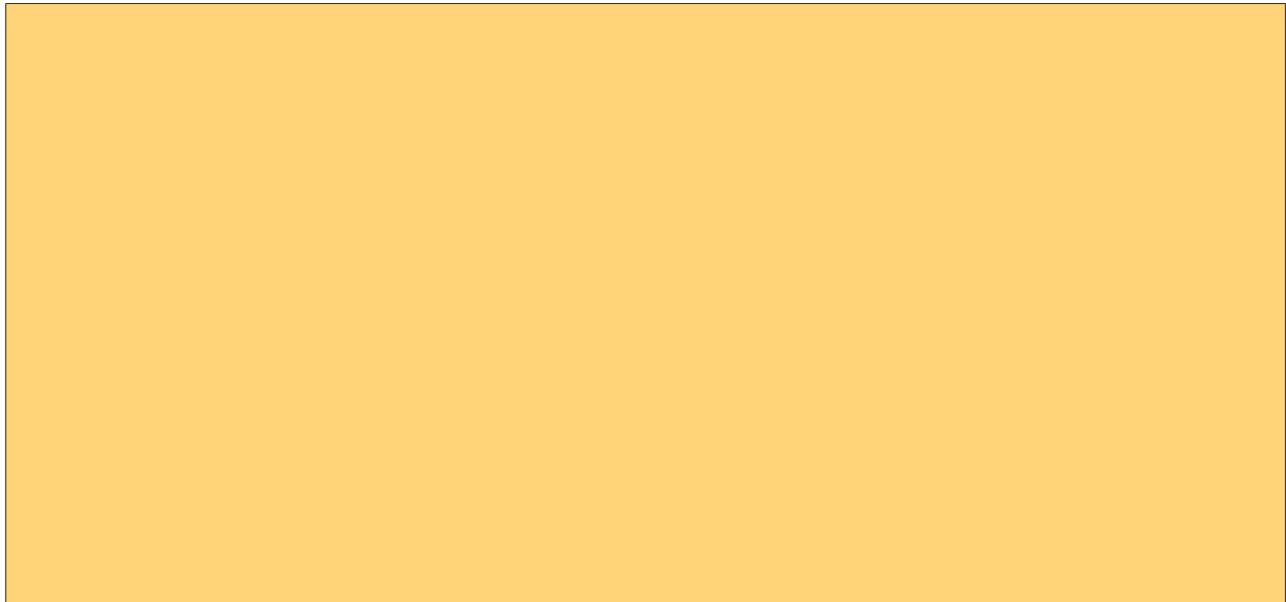

Charts are interactive components, information about selected series and items can be passed via ajax to a JSF backing bean using ItemSelectEvent.

Basic

3.15.12 Export

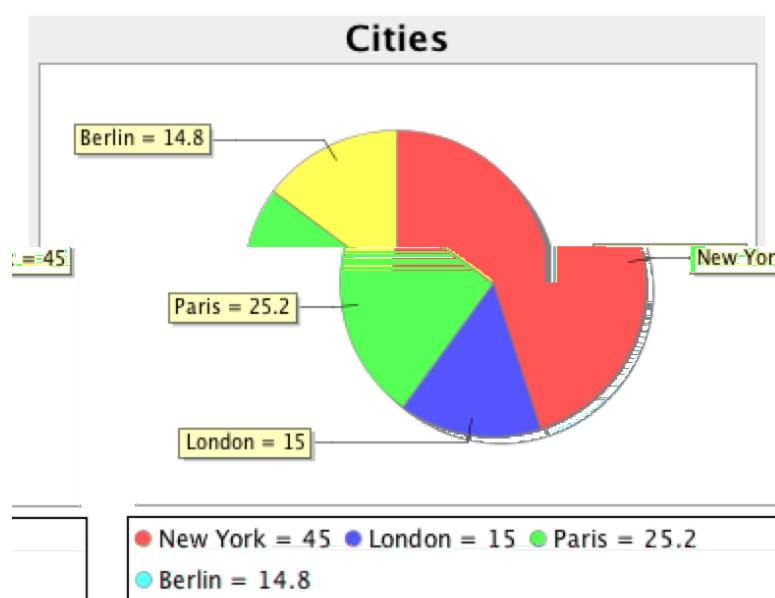

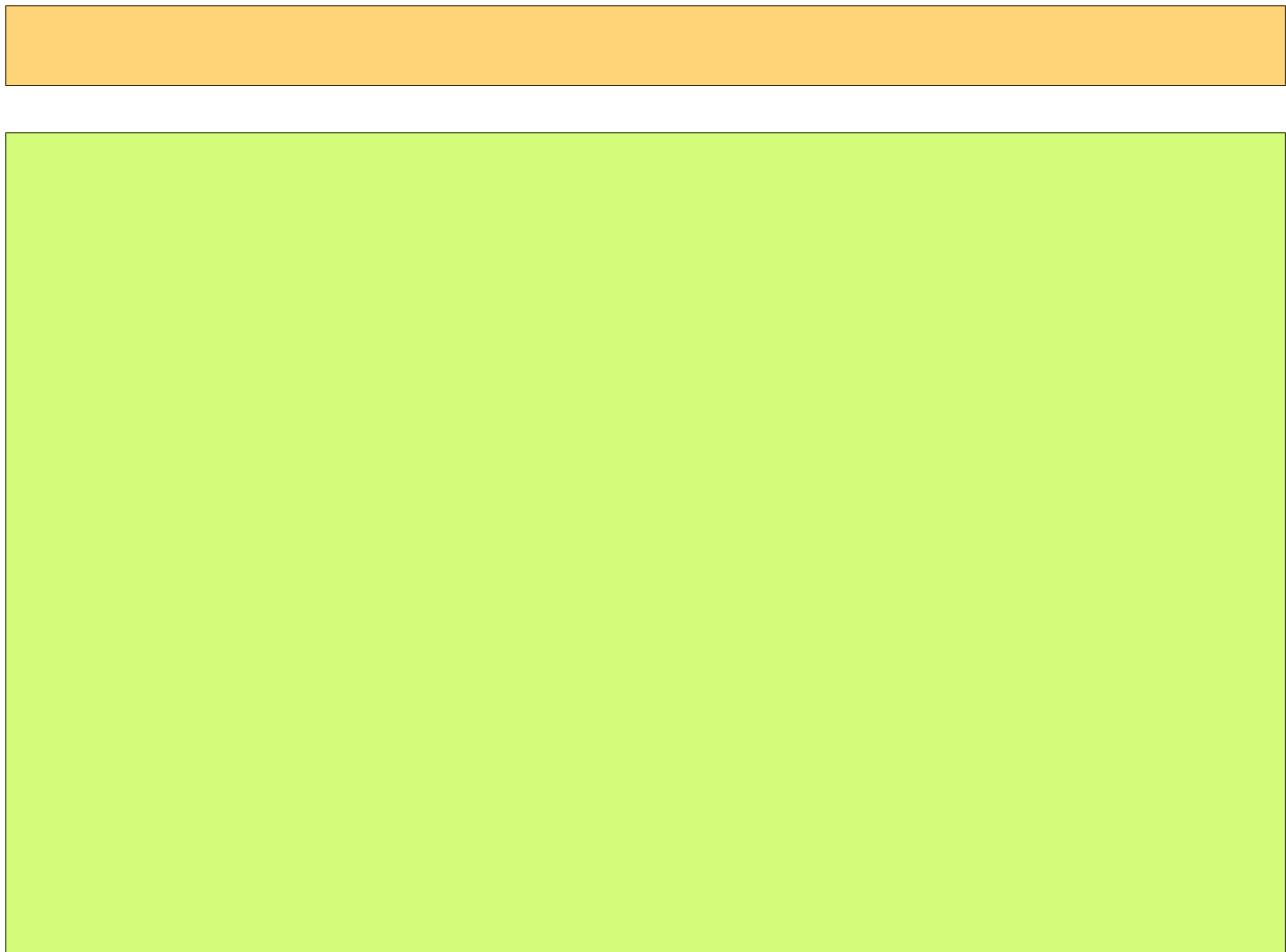

Chart component provides a client side method to convert the graph to an image. Example below demonstrates how to use a button click to export the chart as an image and display it in a dialog so that users can download it as a regular image.

3.15.13 Static Images

JFreeChart with GraphicImage component is an alternative to the chart component.

Basic

3.15.14 Skinning

Charts can be styled using regular css. Following is the list of style classes;

.jqplot-target	Plot target container.
.jqplot-axis	Axes.
.jqplot-xaxis	Primary x-axis.
.jqplot-yaxis	Primary y-axis.
.jqplot-x2axis, .jqplot-x3axis ...	2nd, 3rd ... x-axis.
.jqplot-y2axis, .jqplot-y3axis ...	2nd, 3rd ... y-axis.
.jqplot-axis-tick	Axis ticks.
.jqplot-xaxis-tick	Primary x-axis ticks.
.jqplot-x2axis-tick	Secondary x-axis ticks.
.jqplot-yaxis-tick	Primary y-axis-ticks.
.jqplot-y2axis-tick	Seconday y-axis-ticks.
table.jqplot-table-legend	Legend table.
.jqplot-title	Title of the chart.
.jqplot-cursor-tooltip	Cursor tooltip.
.jqplot-highlighter-tooltip	Highlighter tooltip.
div.jqplot-table-legend-swatch	Colors swatch of the legend.

Additionally *style* and *styleClass* options of chart component apply to the container element of charts, use these attribute to specify the dimensions of a chart.

In case you'd like to change the colors of series, use the *seriesColors* option in ChartModel API.

3.15.15 Extender

Chart API provide high level access to commonly used jqplot options however there are many more customization options available in jqplot. Extender feature provide access to low level apis to do advanced customization by enhancing the configuration object, here is an example to increase shadow depth of the line series where model's extender property is set to "ext".

Refer to jqPlot docs for available options.

3.15.16 Chart API

Axis

org.primefaces.model.chart.Axis

label	null	String	Title of the axis.
min	null	Object	Minimum boundary value.
max	null	Object	Maximum boundary value.
tickAngle	null	Integer	Angle of text, measured clockwise.
tickFormat	null	String	Format string to use with the axis tick formatter
tickInterval	null	String	Number of units between ticks.
TickCount	null	Integer	Desired number of ticks.

AxisType

org.primefaces.model.chart.AxisType

AxisType is an enum to define the type of the axis from X-Y to X9-Y9.

BarChartModel

org.primefaces.model.chart.BarChartModel extends *org.primefaces.model.chart.ChartModel*

barPadding	8	Integer	Padding between bars.
barMargin	10	Integer	Margin between bars.
stacked	false	Boolean	Displays series in stacked format.

BarChartSeries

org.primefaces.model.chart.BarChartSeries extends *org.primefaces.model.chart.ChartSeries*

disableStack	false	Boolean	When true, series data is not included in a stacked chart.

BubbleChartModel

org.primefaces.model.chart.BubbleChartModel extends *org.primefaces.model.chart.ChartModel*

data	null	List<BubbleChartSeries>	Data as a list of BubbleChartSeries.
bubbleGradients	false	Boolean	Displays bubbles with gradients.
bubbleAlpha	1.0	Double	Opacity of bubbles.
showLabels	true	Boolean	Displays label of a series inside a bubble.

BubbleChartSeries

org.primefaces.model.chart.BarChartSeries extends *org.primefaces.model.chart.ChartSeries*

x	null	Integer	X-Axis value of the bubble.
y	null	Integer	Y-Axis value of the bubble.
radius	null	Integer	Radius of the bubble.
label	null	String	Label text of the bubble.

CartesianChartModel

org.primefaces.model.chart.CartesianChartModel

ChartSeries

org.primefaces.model.chart.ChartSeries

label	null	String	Title text of the series.
data	null	Map<Object,Number>	Data of the series as a map.
xaxis	null	AxisType	X-Axis of the series.
yaxis	null	AxisType	Y-Axis of the series.

DateAxis

org.primefaces.model.chart.DateAxis extends *org.primefaces.model.chart.Axis*

DateAxis is used when data on the axis consists of string representations of date values.

DonutChartModel

org.primefaces.model.chart.DonutChartModel extends *org.primefaces.model.chart.ChartModel*

data	null	List>Map<String, Object>>	Data as a list of map instances.
sliceMargin	0	Integer	Angular spacing between pie slices in degrees.
fill	true	Boolean	True or False to fill the slices.
showDataLabels	false	Boolean	True to False show data labels on slices.
dataFormat	percent	String	Either ‘label’, ‘value’, ‘percent’ or an array of labels to place on the pie slices.
dataLabelFormat String	null	String	Format string for data labels. If none, ‘%s’ is used for “label” and for arrays, ‘%d’ for value and ‘%d%%’ for percentage.
dataLabelThreshold	3	Integer	Threshold in percentage (0-100) of pie area, below which no label will be displayed. This applies to all label types, not just to percentage labels.
showDatatip	true	Boolean	Displays tooltip when enabled.
datatipFormat	%s-%d	String	Format string for datatip.
datatipEditor	null	String	Name of client side function that returns html to provide custom content in datatip.

HorizontalBarChartModel

org.primefaces.model.chart.HorizontalBarChartModel extends

org.primefaces.model.chart.BarChartModel

HorizontalBarChartModel is an extension to BarChartModel with y-axis used for the categories and x-axis for the data values.

LineChartSeries

org.primefaces.model.chart.LineChartSeries extends *org.primefaces.model.chart.ChartSeries*

markerStyle	filledCircle	String	Style of the markers, valid values are <i>diamond</i> , <i>circle</i> , <i>square</i> ,

			<i>x, plus, dash, filledDiamond, filledCircle, filledSquare.</i>
showLine	true	Boolean	Whether to actually draw the line or not.
showMarker	true	Boolean	Displays markers at data points.
fill	false	Boolean	Fills the area between lines.
fillAlpha	1	Double	Opacity of the filled area.
smoothLine	false	Boolean	Enables smooth renderer.
disableStack	false	Boolean	When true, series data is not included in a stacked chart.

LinearAxis

org.primefaces.model.chart.LinearAxis extends *org.primefaces.model.chart.Axis*

LinearAxis is the Axis implementation used to display numbers.

LineChartModel

org.primefaces.model.chart.LineChartModel extends

org.primefaces.model.chart.CartesianChartModel

stacked	null	List<ChartSeries>	Displays series in stacked format.
breakOnNull	HashMap	Map<AxisType, Axis>	Discontinues line plot for null values.

MeterGaugeChartModel

org.primefaces.model.chart.MeterGaugeChartModel extends

org.primefaces.model.chart.ChartModel

value	null	Number	Value of the gauge.
intervals	null	List<Number>	List of ranges to be drawn around the gauge.
ticks	0	List<Number>	List of tick values.
gaugeLabel	true	String	Label text of the gauge.
gaugeLabelPosition	false	String	Where to position the label, either ‘inside’ or ‘bottom’.
min	null	Double	Minimum value on the gauge.
max	null	Double	Maximum value on the gauge.
showTickLabels	true	Boolean	Displays tick labels next to ticks.
intervalInnerRadius	null	Integer	Radius of the inner circle of the interval ring.
intervalOuterRadius	85	Integer	Radius of the outer circle of the interval ring.
labelHeightAdjust	-25	Integer	Number of Pixels to offset the label up (-) or down (+) from its default position.

OhlcChartModel

org.primefaces.model.chart.OhlcChartModel extends *org.primefaces.model.chart.ChartModel*

data	null	List<OhlcChartSeries>	Data as a list of OhlcChartSeries.

candleStick	false	Boolean	Displays series as candlestick.

OhlcChartSeries

org.primefaces.model.chart.OhlcChartSeries extends *org.primefaces.model.chart.ChartSeries*

value	null	List<OhlcChartSeries>	Data as a list of OhlcChartSeries.
open	null	Double	Open value.
high	null	Double	High value.
low	null	Double	Low value.
close	null	Double	Close value.

PieChartModel

org.primefaces.model.chart.PieChartModel extends *org.primefaces.model.chart.ChartModel*

data	null	Map<String, Object>	Data as a Map instance.
diameter	null	Integer	Outer diameter of the pie, auto computed by default
sliceMargin	0	Integer	Angular spacing between pie slices in degrees.
fill	true	Boolean	True or False to fill the slices.
showDataLabels	false	Boolean	True to False show data labels on slices.
dataFormat	percent	String	Either ‘label’, ‘value’, ‘percent’ or an array of labels to place on the pie slices.
dataLabelFormat	String	String	Format string for data labels. If none, ‘%s’ is used for “label” and for arrays, ‘%d’ for value and ‘%d%’ for percentage.
dataLabelThreshold	3	Integer	Threshhold in percentage (0-100) of pie area, below which no label will be displayed. This applies to all label types, not just to percentage labels.
showDatatip	true	Boolean	Displays tooltip when enabled.
datatipFormat	%s-%d	String	Format string for datatip.
datatipEditor	null	String	Name of client side function that returns html to provide custom content in datatip.

3.16 Checkbox

Checkbox is a helper component of SelectManyCheckbox to implement custom layouts.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
disabled	false	Boolean	Disabled the component.
itemIndex	null	Integer	Index of the selectItem.
onchange	null	String	Client side callback to execute on state change.
for	null	String	Id of the selectManyCheckbox to attach to.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the container.
tabindex	null	String	Specifies the tab order of element in tab navigation.

Getting started with Checkbox

See custom layout part in SelectManyCheckbox section for more information.

3.17 Chips

Chips is used to enter multiple values on an inputfield.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component.
converter	null	Converter/String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required.
validator	null	MethodExpr	A method expression that refers to a method for validation the input.
valueChangeListener	null	ValueChange Listener	A method binding expression that refers to a method for handling a valuchangeevent.
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.

widgetVar	null	String	Name of the client side widget.
max	null	Integer	Maximum number of entries allowed.

Getting started with Chips

Value of the component should be a List where type of the elements it contains can be a string or a custom one if a converter is defined.

Ajax Behavior Events

itemSelect	org.primefaces.event.SelectEvent	When an item is added.
itemUnselect	org.primefaces.event.UnselectEvent	When an item is removed.

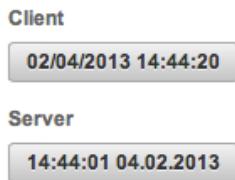

Skinning

Following is the list of structural style classes;

.ui-chips	Container element.
.ui-chips-container	List element.
.ui-chips-token	A list item.
.ui-chips-input-token	List item containing the input.
.ui-chips-token-icon	Close icon of a token.

3.18 Clock

Clock displays server or client datetime live.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
pattern	null	String	Datetime format.
mode	client	String	Mode value, valid values are client and server.
autoSync	false	Boolean	Syncs time periodically in server mode.
syncInterval	60000	Integer	Defines the sync in ms interval in autoSync setting.

Getting Started with Clock

Clock has two modes, *client* (default) and *server*. In simples mode, datetime is displayed by just adding component on page. On page load, clock is initialized and start running based on client time.

Server Mode

In server mode, clock initialized itself with the server's datetime and starts running on client side. To make sure client clock and server clock is synced, you can enable autoSync option that makes an ajax call to the server periodically to refresh the server time with client.

Date Time Format

Datetime format used can be changed using pattern attribute.

Skinning

Clock resides in a container element which *style* and *styleClass* options apply. Following is the list of structural style classes;

.ui-clock	Container element.

3.19 Collector

Collector is a simple utility to manage collections declaratively.

Info

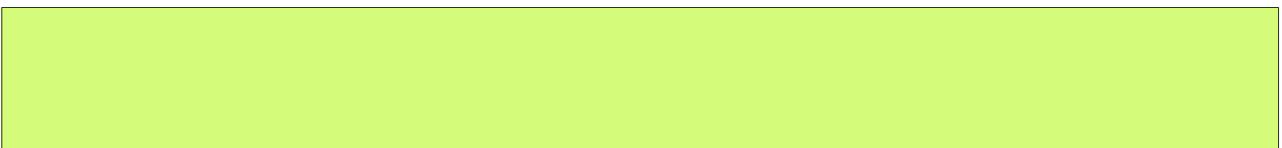

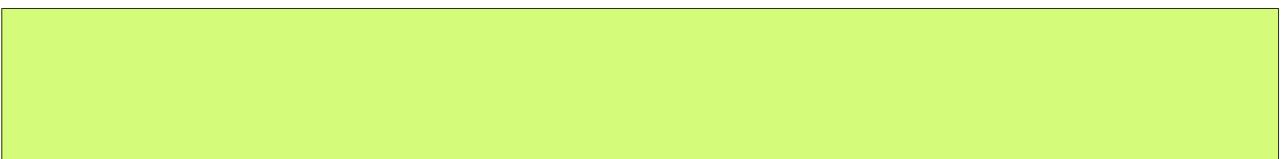

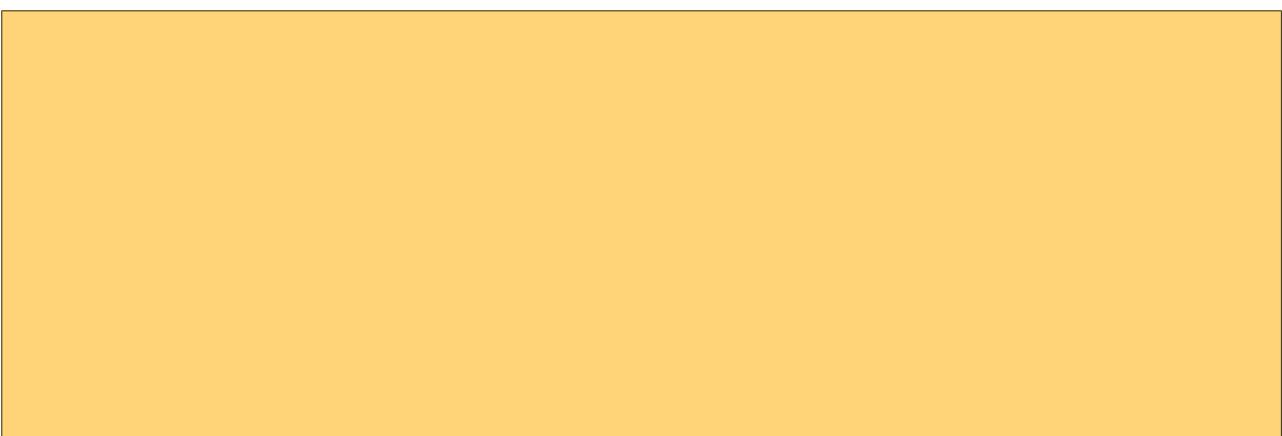

Tag	
ActionListener Class	

Attributes

value	null	Object	Value to be used in collection operation
addTo	null	java.util.Collection	Reference to the Collection instance
removeFrom	null	java.util.Collection	Reference to the Collection instance
unique	true	Boolean	When enabled, rejects duplicate items on addition.

Getting started with Collector

Collector requires a collection and a value to work with. It's important to override equals and hashCode methods of the value object to make collector work.

3.20 Color Picker

ColorPicker is an input component with a color palette.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

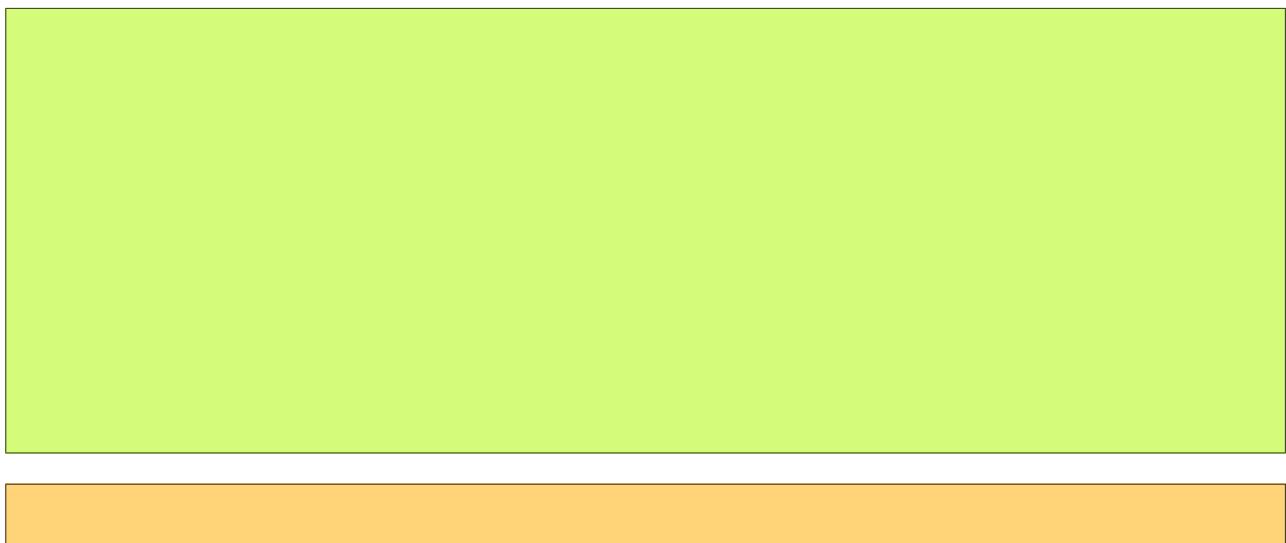

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component.
converter	null	Converter/String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required.
validator	null	MethodExpr	A method expression that refers to a method for validation the input.

valueChangeListener	null	ValueChange Listener	A method binding expression that refers to a method for handling a valuchangeevent.
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
mode	popup	String	Display mode, valid values are “popup” and “inline”.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.

Getting started with ColorPicker

ColorPicker's value should be a hex string.

Display Mode

ColorPicker has two modes, default mode is *popup* and other available option is *inline*.

Skinning

ColorPicker resides in a container element which *style* and *styleClass* options apply. Following is the list of structural style classes;

.ui-colorpicker	Container element.
.ui-colorpicker_color	Background of gradient.
.ui-colorpicker_hue	Hue element.
.ui-colorpicker_new_color	New color display.
.ui-colorpicker_current_color	Current color display.
.ui-colorpicker-rgb-r	Red input.
.ui-colorpicker-rgb-g	Green input.
.ui-colorpicker-rgb-b	Blue input.
.ui-colorpicker-rgb-h	Hue input.
.ui-colorpicker-rgb-s	Saturation input.
.ui-colorpicker-rgb-b	Brightness input.
.ui-colorpicker-rgb-hex	Hex input.

3.21 Column

Column is an extended version of the standard column used by various components like datatable, treeTable and more.

Info

Tag	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
style	null	String	Inline style of the column.
styleClass	null	String	Style class of the column.
sortBy	null	ValueExpr	ValueExpression to be used for sorting.
sortFunction	null	MethodExpr	Custom pluggable sortFunction.
filterBy	null	ValueExpr	ValueExpression to be used for filtering.
filterStyle	null	String	Inline style of the filter element
filterStyleClass	null	String	Style class of the filter element
filterOptions	null	Object	A collection of selectItems for filter dropdown.
filterMatchMode	startsWith	String	Match mode for filtering.
filterPosition	bottom	String	Location of the column filter with respect to header content. Options are 'bottom'(default) and 'top'.
rowspan	1	Integer	Defines the number of rows the column spans.
colspan	1	Integer	Defines the number of columns the column spans.
headerText	null	String	Shortcut for header facet.
footerText	null	String	Shortcut for footer facet.

selectionMode	null	String	Enables selection mode.
filterMaxLength	null	Integer	Maximum number of characters for an input filter.
resizable	true	Boolean	Specifies resizable feature at column level. Datatable's resizableColumns must be enabled to use this option.
width	null	String	Width in pixels or percentage.
exportable	true	Boolean	Defines if the column should be exported by dataexporter.
filterValue	null	Object	Value of the filter field.
toggable	true	Boolean	Defines if panel is toggable by columnToggler component. Default value is true and a false value marks the column as static.
filterFunction	null	MethodExpr	Custom implementation to filter a value against a constraint.
field	null	String	Name of the field to pass lazy load method for filtering and sorting. If not specified, filterBy-sortBy values are used to identify the field name.
priority	0	Integer	Priority of the column defined as an integer, lower values have more priority.
sortable	true	Boolean	Boolean value to mark column as sortable.
filterable	true	Boolean	Boolean value to mark column as filterable.
visible	true	Boolean	Controls the visibility of the column.
selectRow	true	Boolean	Whether clicking the column selects the row when parent component has row selection enabled, default is true.
ariaHeaderText	null	String	Label to read by screen readers, when not specified headerText is used.
exportFunction	null	MethodExpr	Custom pluggable exportFunction for data exporter.

Getting Started with Column

As column is a reused component, see documentation of components that use a column.

Note

Not all attributes of column are implemented by the components that utilize column.

3.22 Columns

Columns is used by datatable to create columns dynamically.

Info

Tag	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Data to represent columns.
var	null	String	Name of iterator to access a column.
style	null	String	Inline style of the column.
styleClass	null	String	Style class of the column.
sortBy	null	ValueExpr	ValueExpression to be used for sorting.
sortFunction	null	MethodExpr	Custom pluggable sortFunction.
filterBy	null	ValueExpr	ValueExpression to be used for filtering.
filterStyle	null	String	Inline style of the filter element
filterStyleClass	null	String	Style class of the filter element
filterOptions	null	Object	A collection of selectitems for filter dropdown.
filterMatchMode	startsWith	String	Match mode for filtering.
rowspan	1	Integer	Defines the number of rows the column spans.
colspan	1	Integer	Defines the number of columns the column spans.
headerText	null	String	Shortcut for header facet.
footerText	null	String	Shortcut for footer facet.

filterMaxLength	null	Integer	Maximum number of characters for an input filter.
resizable	true	Boolean	Specifies resizable feature at column level. Datatable's resizableColumns must be enabled to use this option.
width	null	String	Width in pixels or percentage.
exportable	true	Boolean	Defines if the column should be exported by dataexporter.
columnIndexVar	null	String	Name of iterator to refer each index.
filterValue	null	Object	Value of the filter field.
toggleable	true	Boolean	Defines if panel is toggleable by columnToggler component. Default value is true and a false value marks the column as static.
filterFunction	null	MethodExpr	Custom implementation to filter a value against a constraint.
field	null	String	Name of the field to pass lazy load method for filtering and sorting. If not specified, filterBy-sortBy values are used to identify the field name.
priority	0	Integer	Priority of the column defined as an integer, lower values have more priority.
sortable	true	Boolean	Boolean value to mark column as sortable.
filterable	true	Boolean	Boolean value to mark column as filterable.
visible	true	Boolean	Controls the visibility of the column.
selectRow	true	Boolean	Whether clicking the column selects the row when parent component has row selection enabled, default is true.

Getting Started with Columns

See dynamic columns section in datatable documentation for detailed information.

3.23 ColumnGroup

ColumnGroup is used by datatable for column grouping.

Info

Tag	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
type	null	String	Type of group, valid values are “header” and “footer”.

Getting Started with ColumnGroup

See grouping section in datatable documentation for detailed information.

3.24 ColumnToggler

ColumnToggler is a helper component for datatable to toggle visibility of columns.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
trigger	null	String	A search expression resolving to a component to get attached to.
datasource	null	String	A search expression resolving to a DataTable component whose columns to be toggled.

Getting Started with ColumnToggler

See column toggler section in datatable documentation for detailed information.

3.25 CommandButton

CommandButton is an extended version of standard commandButton with ajax and theming.

[Ajax Submit](#)
[Non-Ajax Submit](#)
[With Icon](#)

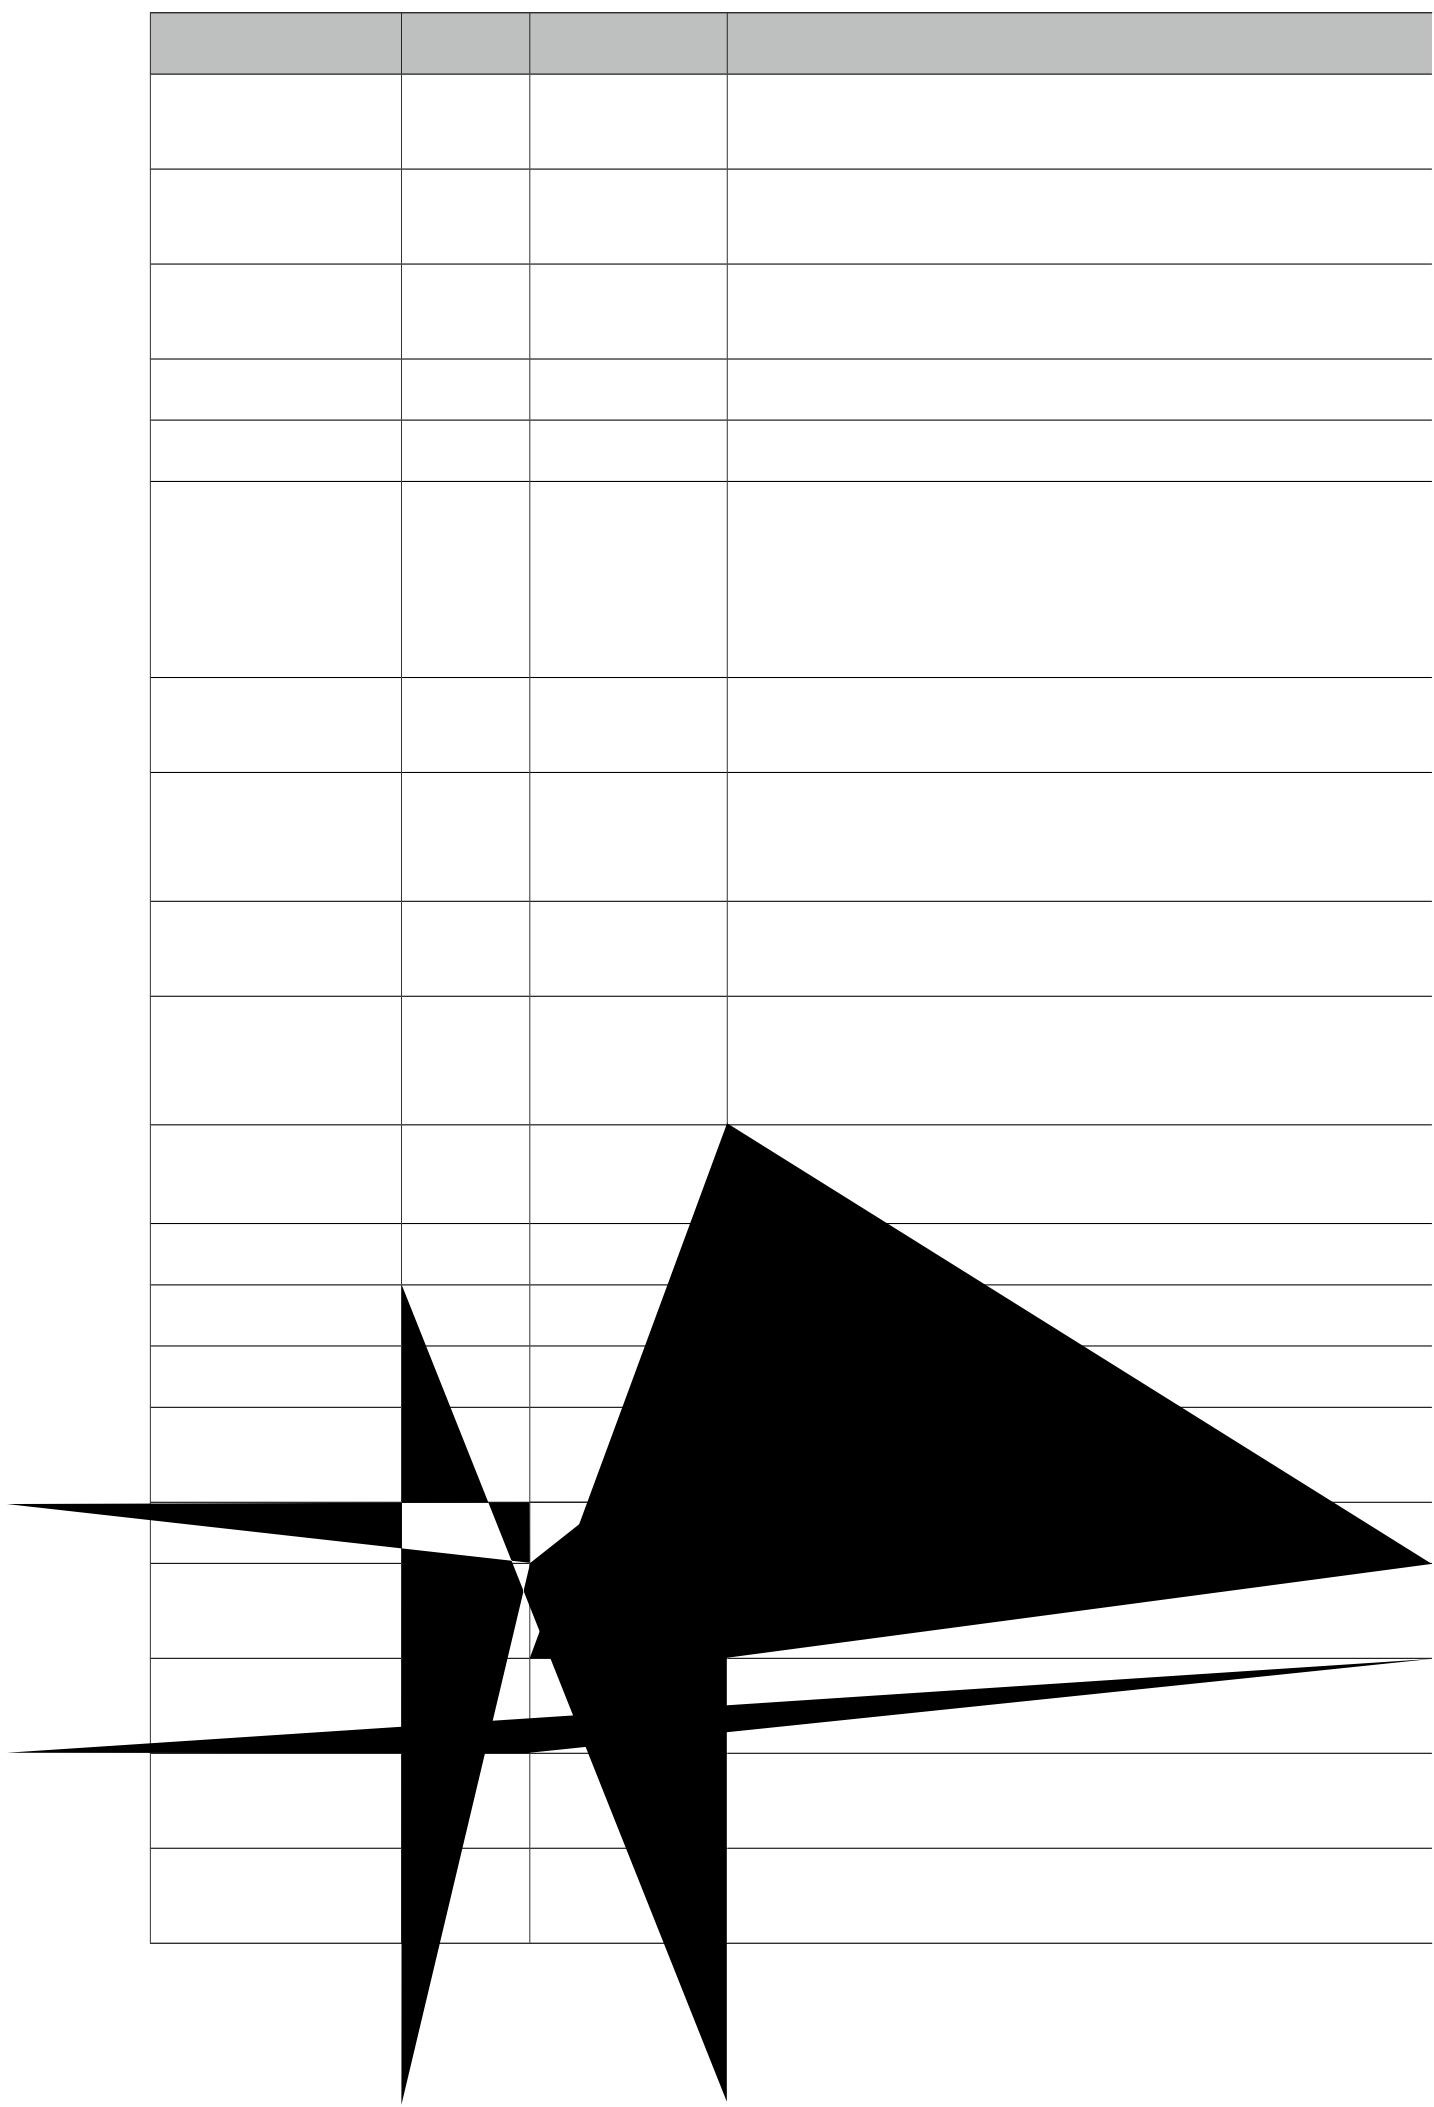

[Disabled](#)

Renderer Class	

Attributes

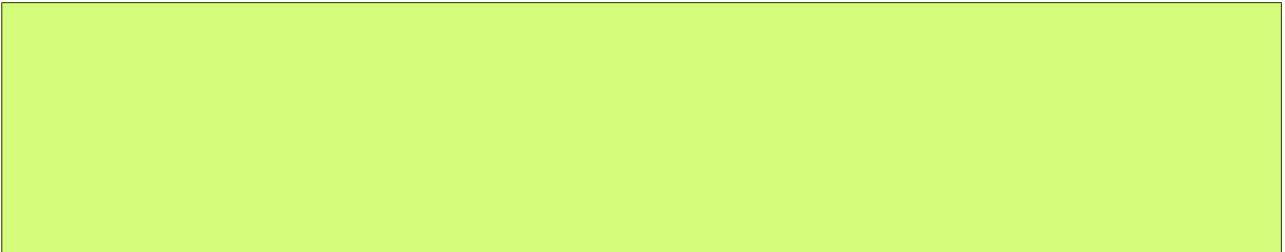

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>value</code>	null	String	Label for the button
<code>action</code>	null	MethodExpr/ String	A method expression or a String outcome that'd be processed when button is clicked.
<code>actionListener</code>	null	MethodExpr	An actionlistener that'd be processed when button is clicked.
<code>immediate</code>	false	Boolean	Boolean value that determines the phaseId, when true actions are processed at apply_request_values, when false at invoke_application phase.
<code>type</code>	submit	String	Sets the behavior of the button.
<code>ajax</code>	true	Boolean	Specifies the submit mode, when set to true(default), submit would be made with Ajax.
<code>async</code>	false	Boolean	When set to true, ajax requests are not queued.
<code>process</code>	null	String	Component(s) to process partially instead of whole view.
<code>update</code>	null	String	Component(s) to be updated with ajax.

onkeyup	null	String	Client side callback to execute when a key is released over button.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over button.
onmousemove	null	String	Client side callback to execute when a pointer button is moved within button.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from button.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto button.
onmouseup	null	String	Client side callback to execute when a pointer button is released over button.
onselect	null	String	Client side callback to execute when text within button is selected by user.
accesskey	null	String	Access key that when pressed transfers focus to the button.
alt	null	String	Alternate textual description of the button.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
disabled	false	Boolean	Disables the button.
image	null	String	Style class for the button icon. (deprecated: use icon)
label	null	String	A localized user presentable name.
lang	null	String	Code describing the language used in the generated markup for this component.
tabindex	null	Integer	Position of the button element in the tabbing order.
title	null	String	Advisory tooltip information.
icon	null	String	Icon of the button as a css class.
iconPos	left	String	Position of the icon.
inline	false	String	Used by PrimeFaces mobile only.
escape	true	Boolean	Defines whether label would be escaped or not.
widgetVar	null	String	Name of the client side widget.
form	null	String	Form to serialize for an ajax request. Default is the enclosing form.
RenderDisabled Click	true	Boolean	When enabled, click event can be added to disabled button.

Getting started with CommandButton

CommandButton usage is similar to standard commandButton, by default commandButton submits its enclosing form with ajax.

Reset Buttons

Reset buttons do not submit the form, just resets the form contents.

Push Buttons

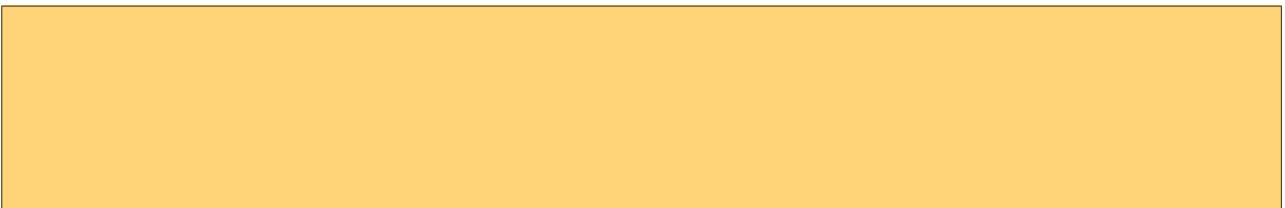

Push buttons are used to execute custom javascript without causing an ajax/non-ajax request. To create a push button set type as "button".

AJAX and Non-AJAX

CommandButton has built-in ajax capabilities, ajax submit is enabled by default and configured using *ajax* attribute. When ajax attribute is set to false, form is submitted with a regular full page refresh.

The *update* attribute is used to partially update other component(s) after the ajax response is received. Update attribute takes a comma or white-space separated list of JSF component ids to be updated. Basically any JSF component, not just PrimeFaces components should be updated with the Ajax response. In the following example, form is submitted with ajax and *display* outputText is updated with the ajax response.

Icons

An icon on a button is provided using *icon* option. *iconPos* is used to define the position of the button which can be “left” or “right”.

.disk is a simple css class with a background property;

You can also use the pre-defined icons from ThemeRoller like *ui-icon-search*.

Client Side API

Widget: *PrimeFaces.widget.CommandButton*

disable()	-	void	Disables button
enable()	-	void	Enables button

Skinning

CommandButton renders a button tag which *style* and *styleClass* applies. Following is the list of structural style classes;

.ui-button	Button element
.ui-button-text-only	Button element when icon is not used
.ui-button-text	Label of button

As skinning style classes are global, see the main theming section for more information.

3.26 CommandLink

CommandLink extends standard JSF commandLink with Ajax capabilities.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

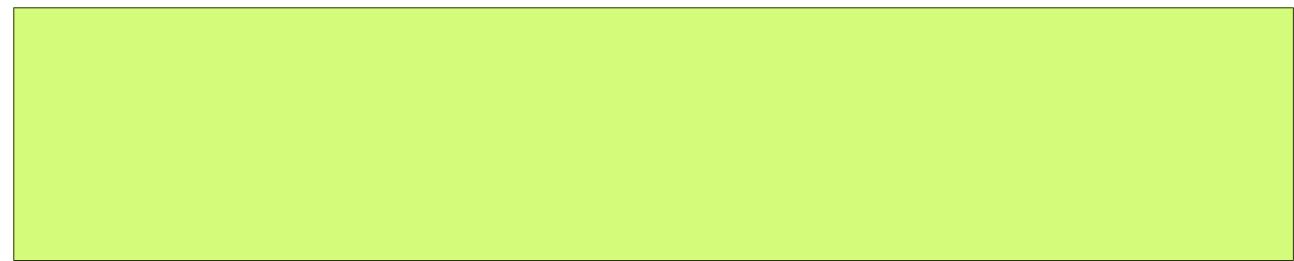

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	String	Href value of the rendered anchor.
action	null	MethodExpr/ String	A method expression or a String outcome that'd be processed when link is clicked.
actionListener	null	MethodExpr	An actionlistener that'd be processed when link is clicked.
immediate	false	Boolean	Boolean value that determines the phaseId, when true actions are processed at apply_request_values, when false at invoke_application phase.
async	false	Boolean	When set to true, ajax requests are not queued.
process	null	String	Component(s) to process partially instead of whole view.
ajax	true	Boolean	Specifies the submit mode, when set to true(default), submit would be made with Ajax.
update	null	String	Component(s) to be updated with ajax.
onstart	null	String	Client side callback to execute before ajax request is begins.

oncomplete	null	String	Client side callback to execute when ajax request is completed.
onsuccess	null	String	Client side callback to execute when ajax request succeeds.
onerror	null	String	Client side callback to execute when ajax request fails.
global	true	Boolean	Defines whether to trigger ajaxStatus or not.
delay	null	String	If less than <i>delay</i> milliseconds elapses between calls to <i>request()</i> only the most recent one is sent and all other requests are discarded. If this option is not specified, or if the value of <i>delay</i> is the literal string 'none' without the quotes, no delay is used.
partialSubmit	false	Boolean	Enables serialization of values belonging to the partially processed components only.
partialSubmitFilter	null	String	Selector to use when partial submit is on, default is ".:input" to select all descendant inputs of a partially processed components.
resetValues	false	Boolean	If true, local values of input components to be updated within the ajax request would be reset.
ignoreAutoUpdate	false	Boolean	If true, components which autoUpdate="true" will not be updated for this request. If not specified, or the value is false, no such indication is made.
timeout	0	Integer	Timeout for the ajax request in milliseconds.
style	null	String	Style to be applied on the anchor element
styleClass	null	String	StyleClass to be applied on the anchor element
onblur	null	String	Client side callback to execute when link loses focus.
onclick	null	String	Client side callback to execute when link is clicked.
ondblclick	null	String	Client side callback to execute when link is double clicked.
onfocus	null	String	Client side callback to execute when link receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over link.
onkeypress	null	String	Client side callback to execute when a key is pressed and released over link.
onkeyup	null	String	Client side callback to execute when a key is released over link.

onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over link.
onmousemove	null	String	Client side callback to execute when a pointer button is moved within link.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from link.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto link.
onmouseup	null	String	Client side callback to execute when a pointer button is released over link.
accesskey	null	String	Access key that when pressed transfers focus to the link.
charset	null	String	Character encoding of the resource designated by this hyperlink.
coords	null	String	Position and shape of the hot spot on the screen for client use in image maps.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
disabled	null	Boolean	Disables the link
hreflang	null	String	Language code of the resource designated by the link.
rel	null	String	Relationship from the current document to the anchor specified by the link, values are provided by a space-separated list of link types.
rev	null	String	A reverse link from the anchor specified by this link to the current document, values are provided by a space-separated list of link types.
shape	null	String	Shape of hot spot on the screen, valid values are default, rect, circle and poly.
tabindex	null	Integer	Position of the button element in the tabbing order.
target	null	String	Name of a frame where the resource targeted by this link will be displayed.
title	null	String	Advisory tooltip information.
type	null	String	Type of resource referenced by the link.
form	null	String	Form to serialize for an ajax request. Default is the enclosing form.

Getting Started with CommandLink

CommandLink is used just like the standard h:commandLink, difference is form is submitted with ajax by default.

Skinning

CommandLink renders an html anchor element that *style* and *styleClass* attributes apply.

3.27 Confirm

Confirm is a behavior element used to integrate with global confirm dialog.

Info

Tag	
Behavior Id	

Attributes

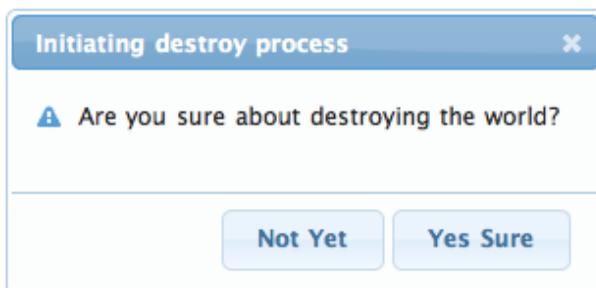

header	null	String	Header of confirm dialog.
message	null	String	Message to display in confirm dialog.
icon	null	String	Icon to display next to message.
disabled	null	Boolean	Disables confirm behavior when true.

Getting started with Confirm

See global confirm dialog topic in next section for details.

3.28 ConfirmDialog

ConfirmDialog is a replacement to the legacy javascript confirmation box. Skinning, customization and avoiding popup blockers are notable advantages over classic javascript confirmation.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

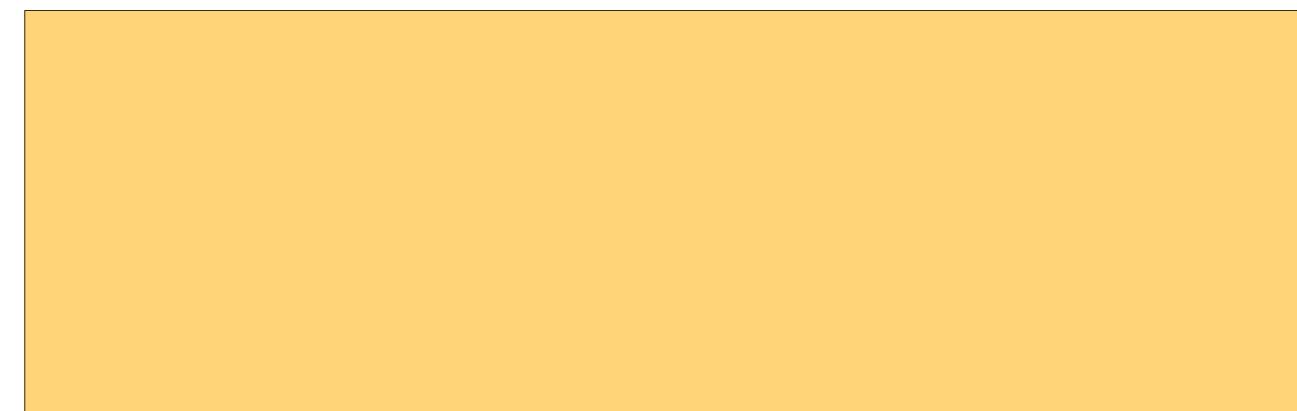

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
message	null	String	Text to be displayed in body.
header	null	String	Text for the header.
severity	null	String	Message severity for the displayed icon.
width	auto	Integer	Width of the dialog in pixels
height	auto	Integer	Width of the dialog in pixels
style	null	String	Inline style of the dialog container.
styleClass	null	String	Style class of the dialog container

closable	true	Boolean	Defines if close icon should be displayed or not
appendTo	null	String	Appends the dialog to the element defined by the given search expression.
visible	false	Boolean	Whether to display confirm dialog on load.
showEffect	null	String	Effect to use on showing dialog.
hideEffect	null	String	Effect to use on hiding dialog.
closeOnEscape	false	Boolean	Defines if dialog should hide on escape key.
dir	ltr	String	Defines text direction, valid values are <i>ltr</i> and <i>rtl</i> .
global	false	Boolean	When enabled, confirmDialog becomes a shared for other components that require confirmation.
responsive	false	Boolean	In responsive mode, dialog adjusts itself based on screen width.

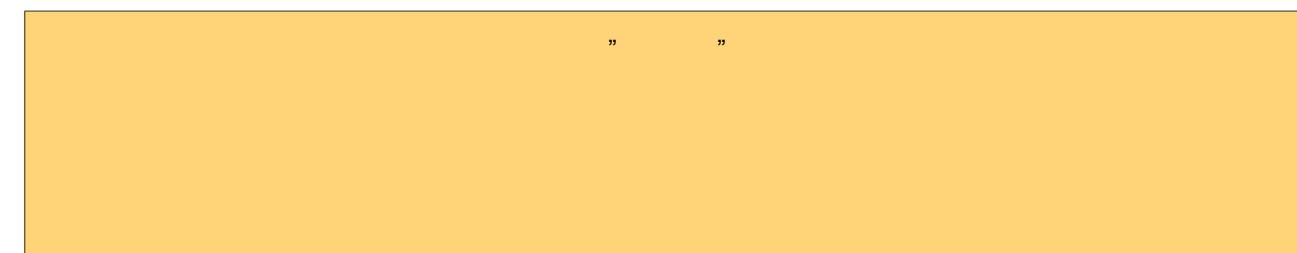

Getting started with ConfirmDialog

ConfirmDialog has two modes; global and non-global. Non-Global mode is almost same as the dialog component used with a simple client side api, *show()* and *hide()*.

Message and Severity

Message can be defined in two ways, either via message option or message facet. Message facet is useful if you need to place custom content instead of simple text. Note that header can also be defined using the *header* attribute or the *header* facet. Severity defines the icon to display next to the message, default severity is *alert* and the other option is *info*.

Global

Creating a confirmDialog for a specific action is a repetitive task, to solve this global confirmDialog which is a singleton has been introduced. Trigger components need to have p:confirm behavior to use the confirm dialog. Component that trigger the actual command in dialog must have *ui-confirm-dialog-yes* style class, similarly component to cancel the command must have *ui-confirm-dialog-no*. At the moment p:confirm is supported by p:commandButton, p:commandLink and p:menuitem.

Client Side API

Widget: *PrimeFaces.widget.ConfirmDialog*

show()	-	void	Displays dialog.
hide()	-	void	Closes dialog.

Skinning

ConfirmDialog resides in a main container element which *style* and *styleClass* options apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-dialog	Container element of dialog
.ui-dialog-titlebar	Title bar
.ui-dialog-title	Header text
.ui-dialog-titlebar-close	Close icon
.ui-dialog-content	Dialog body
.ui-dialog-buttonpane	Footer button panel

3.29 ContentFlow

ContentFlow is a horizontal content gallery component with a slide animation.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

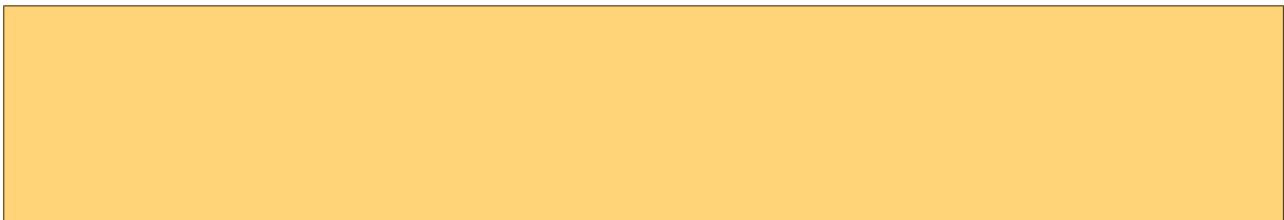

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
widgetVar	null	String	Name of the client side widget.
value	null	String	Collection of items to display.
var	null	String	Name of the iterator to display an item.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.

Getting Started with ContentFlow

ContentFlow requires content as children that can either be defined dynamically using iteration or one by one. Each item must have the content style class applied as well.

Static Images

Dynamic Images

Caption

To present a caption along with an item, embed a div with "caption" style class inside.

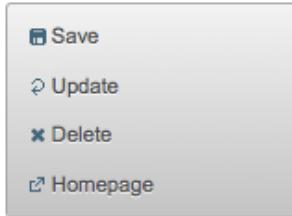

Skinning

ContentFlow resides in a container element which *style* and *styleClass* options apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-contentflow	Container element.
.flow	Container of item list
.item	Item container
.caption	Caption element

3.30 ContextMenu

ContextMenu provides an overlay menu displayed on mouse right-click event.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

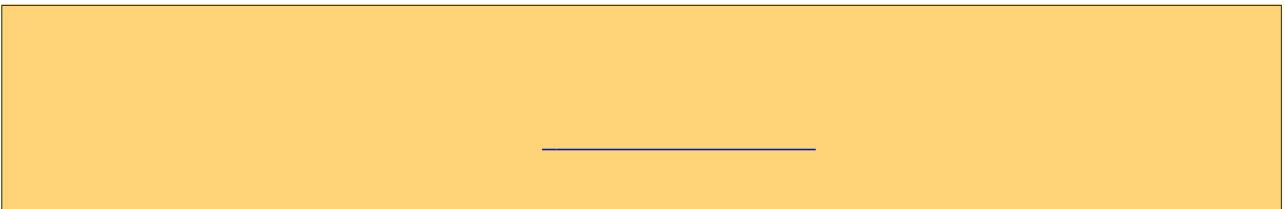

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
for	null	String	Id of the component to attach to
style	null	String	Style of the main container element
styleClass	null	String	Style class of the main container element
model	null	MenuModel	Menu model instance to create menu programmatically.
nodeType	null	String	Specific type of tree nodes to attach to.
event	null	String	Event to bind contextMenu display, default is contextmenu aka right click.
beforeShow	null	String	Client side callback to execute before showing.
selectionMode	multiple	String	Defines the selection behavior, e.g "single" or "multiple".

targetFilter	null	String	Selector to filter the elements to attach the menu.

Getting started with ContextMenu

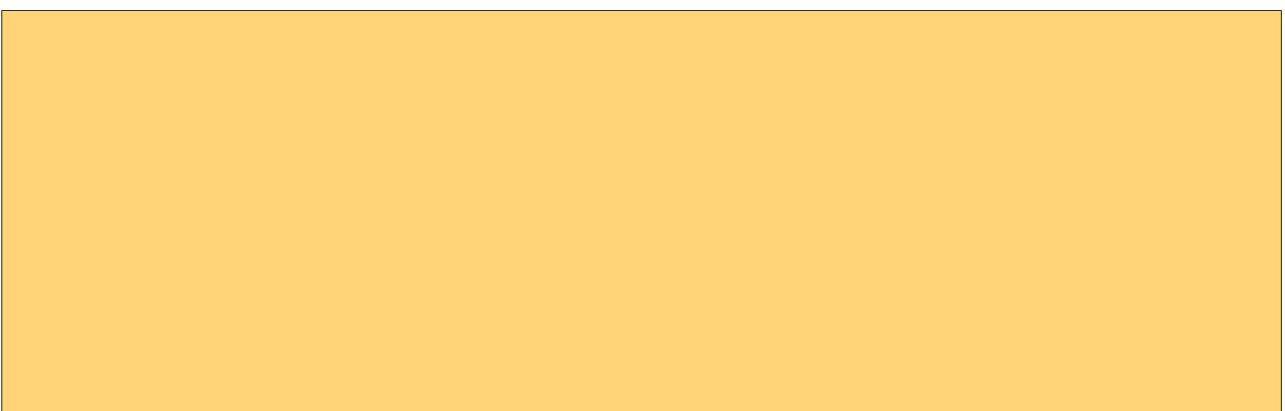

ContextMenu is created with submenus and menuitems. Optional for attribute defines which component the contextMenu is attached to. When for is not defined, contextMenu is attached to the page meaning, right-click on anywhere on page will display the menu.

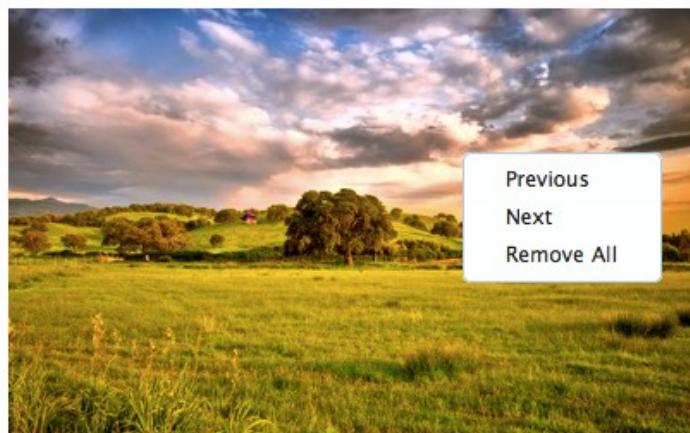

ContextMenu example above is attached to the whole page and consists of three different menuitems with different use cases. First menuitem triggers an ajax action, second one triggers a non-ajax action and third one is used for navigation.

Attachment

ContextMenu can be attached to any JSF component, this means right clicking on the attached component will display the contextMenu. Following example demonstrates an integration between contextMenu and imageSwitcher, contextMenu here is used to navigate between images.

Now right-clicking anywhere on an image will display the contextMenu like;

Data Components

Data components like datatable, tree and treeTable has special integration with context menu, see the documentation of these component for more information.

Dynamic Menus

ContextMenu can be created programmatically as well, see the dynamic menus part in menu component section for more information and an example.

Skinning

ContextMenu resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-contextmenu	Container element of menu
.ui-menu-list	List container
.ui-menuitem	Each menu item
.ui-menuitem-link	Anchor element in a link item
.ui-menuitem-text	Text element in an item

As skinning style classes are global, see the main theming section for more information.

3.31 Dashboard

Dashboard provides a portal like layout with drag&drop based reorder capabilities.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>widgetVar</code>	null	String	Name of the client side widget
<code>model</code>	null	Dashboard Model	Dashboard model instance representing the layout of the UI.
<code>disabled</code>	false	Boolean	Disables reordering feature.
<code>style</code>	null	String	Inline style of the dashboard container
<code>styleClass</code>	null	String	Style class of the dashboard container

Getting started with Dashboard

Dashboard is backed by a DashboardModel and consists of panel components.

Dashboard model simply defines the number of columns and the widgets to be placed in each column. See the end of this section for the detailed Dashboard API.

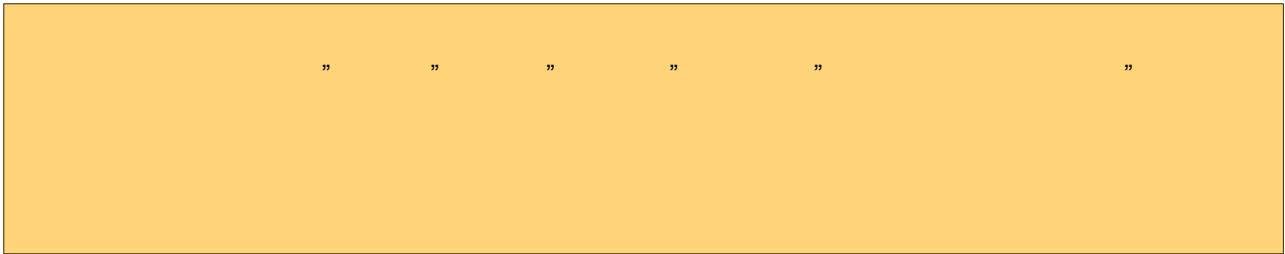

State

Dashboard is a stateful component, whenever a widget is reordered dashboard model will be updated, by persisting the user changes so you can easily create a stateful dashboard.

Ajax Behavior Events

“reorder” is the one and only ajax behavior event provided by dashboard, this event is fired when dashboard panels are reordered. A defined listener will be invoked by passing an `org.primefaces.event.DashboardReorderEvent` instance containing information about reorder.

Following dashboard displays a message about the reorder event

If a widget is reordered in the same column, `senderColumnIndex` will be null. This field is populated only when a widget is transferred to a column from another column. Also when the listener is invoked, dashboard has already updated it's model.

Disabling Dashboard

If you'd like to disable reordering feature, set `disabled` option to true.

Toggle, Close and Options Menu

Widgets presented in dashboard can be closable, toggleable and have options menu as well, dashboard doesn't implement these by itself as these features are already provided by the panel component. See panel component section for more information.

New Widgets

Draggable component is used to add new widgets to the dashboard. This way you can add new panels from outside of the dashboard.

Skinning

Dashboard resides in a container element which style and styleClass options apply. Following is the list of structural style classes;

.ui-dashboard	Container element of dashboard
.ui-dashboard-column	Each column in dashboard
div.ui-state-hover	Placeholder

As skinning style classes are global, see the main theming section for more information. Here is an example based on a different theme;

Tips

- Provide a column width using *ui-dashboard-column* style class otherwise empty columns might not receive new widgets.

Dashboard Model API

org.primefaces.model.DashboardModel (*org.primefaces.model.map.DefaultDashboardModel* is the default implementation)

void addColumn(DashboardColumn column)	Adds a column to the dashboard
List<DashboardColumn> getColumns()	Returns all columns in dashboard
int getColumnCount()	Returns the number of columns in dashboard
DashboardColumn getColumn(int index)	Returns the dashboard column at given index
void transferWidget(DashboardColumn from, DashboardColumn to, String widgetId, int index)	Relocates the widget identified with widget id to the given index of the new column from old column.

org.primefaces.model.DashboardColumn (*org.primefaces.model.map.DefaultDashboardModel* is the default implementation)

void removeWidget(String widgetId)	Removes the widget with the given id
List<String> getWidgets()	Returns the ids of widgets in column
int getWidgetCount()	Returns the count of widgets in column
String getWidget(int index)	Returns the widget id with the given index
void addWidget(String widgetId)	Adds a new widget with the given id
void addWidget(int index, String widgetId)	Adds a new widget at given index
void reorderWidget(int index, String widgetId)	Updates the index of widget in column

3.32 DataExporter

DataExporter is handy for exporting data listed using a Primefaces Datatable to various formats such as excel, pdf, csv and xml.

Info

Tag	
Tag Class	
ActionListener Class	

Attributes

type	null	String	Export type: "xls","pdf","csv", "xml"
target	null	String	Search expression to resolve one or multiple datatables.
fileName	null	String	Filename of the generated export file, defaults to datatable id.
pageOnly	0	String	Exports only current page instead of whole dataset
preProcessor	null	MethodExpr	PreProcessor for the exported document.
postProcessor	null	MethodExpr	PostProcessor for the exported document.
encoding	UTF-8	Boolean	Character encoding to use
selectionOnly	false	Boolean	When enabled, only selection would be exported.
repeat	false	Boolean	Set to true if target is a datatable that is rendered multiple times in a repeating component.
options	null	ExporterOptions	Options object to customize document.

Getting Started with DataExporter

DataExporter is nested in a UICommand component such as commandButton or commandLink. For pdf exporting `com.lowagie.text` and for xls exporting `org.apache.poi` libraries are required in the classpath. Target must point to a PrimeFaces Datatable. Assume the table to be exported is defined as;

Excel export (type="xls | xlsx | xlstxstream")

PDF export (type="pdf")

CSV export (type="csv")

XML export (type="xml")

PageOnly

By default dataExporter works on whole dataset, if you'd like export only the data displayed on current page, set pageOnly to true.

Excluding Columns

In case you need one or more columns to be ignored set *exportable* option of column to false.

Monitor Status

DataExport is a non-ajax process so ajaxStatus component cannot apply. See FileDownload Monitor Status section to find out how monitor export process. Same solution applies to data export as well.

Custom Export

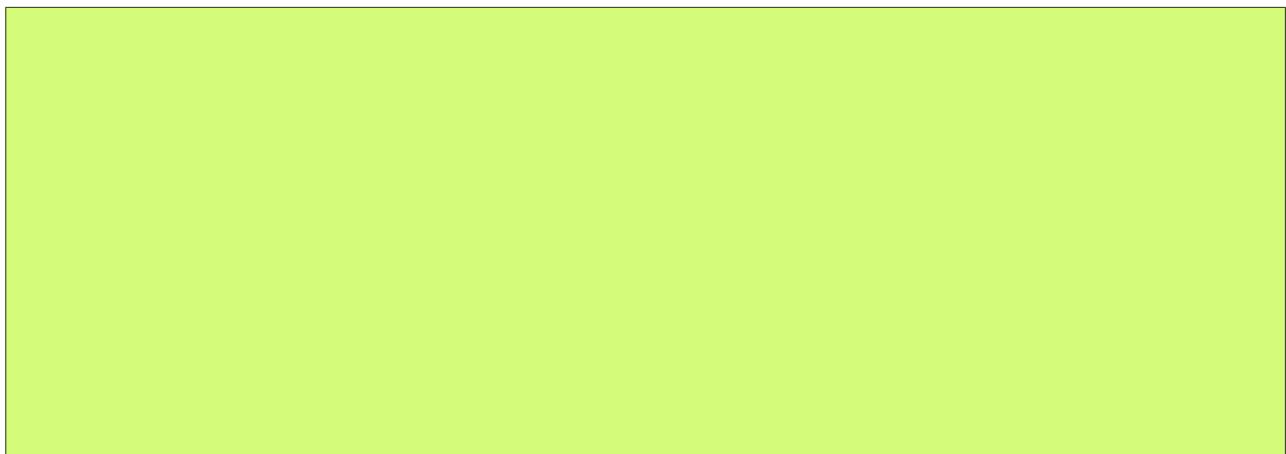

If you need to provide a custom way to retrieve the string value of a column in export, use *exportFunction* property of a column that resolves to a method expression. This method takes the column instance and should return a string to be included exported document.

Pre and Post Processors

Processors are handy to customize the exported document (e.g. add logo, caption ...). PreProcessors are executed before the data is exported and PostProcessors are processed after data is included in the document. Processors are simple java methods taking the document as a parameter.

Change Excel Table Header

First example of processors changes the background color of the exported excel's headers.

Add Logo to PDF

This example adds a logo to the PDF before exporting begins.

Customization

Excel and PDF documents can be further customized using exporterOptions property that takes a configuration object that implements *ExporterOptions*.

3.33 DataGrid

DataGrid displays a collection of data in a grid layout.

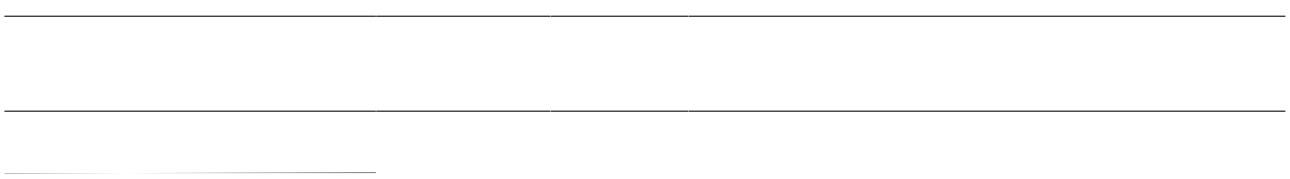

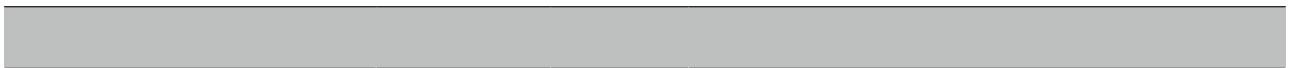

Info

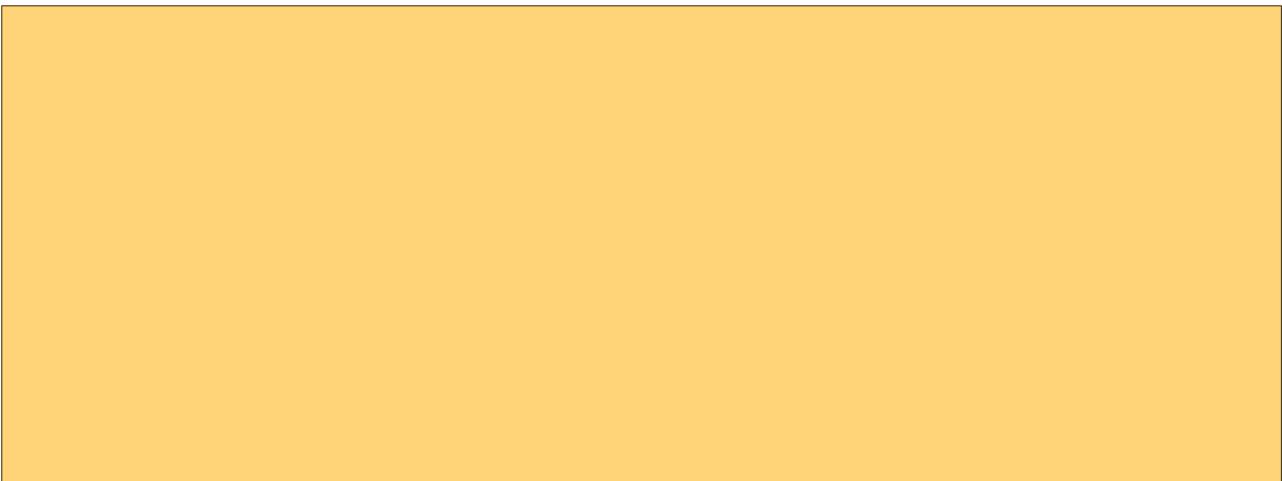

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

<code>id</code>	<code>null</code>	<code>String</code>	Unique identifier of the component
<code>rendered</code>	<code>true</code>	<code>Boolean</code>	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	<code>null</code>	<code>Object</code>	An el expression that maps to a server side UIComponent instance in a backing bean

The code for CarBean that would be used to bind the datagrid to the car list.

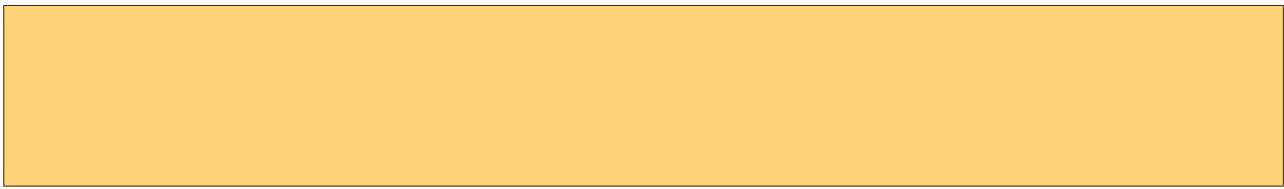

This datagrid has 3 columns and 12 rows. As datagrid extends from standard UIData, rows correspond to the number of data to display not the number of rows to render so the actual number of rows to render is $\text{rows}/\text{columns} = 4$. As a result datagrid is displayed as;

5a0e3ce6	c0a66869	cd25ac27
 1978	 1991	 1991
68d039c4	.0c2874f1	.0a32e04e
 1992	 1992	 2002
b15a8440	be31e447	b112c8e2
 2009	 1969	 1987
e1e29105	927e4405	b5b5c6a5
 1983	 1992	 2008

Ajax Pagination

DataGrid has a built-in paginator that is enabled by setting paginator option to true.

Paginator Template

Paginator is customized using paginatorTemplateOption that accepts various keys of UI controls. Note that this section applies to dataGrid, dataList and dataTable.

- FirstPageLink
- LastPageLink
- PreviousPageLink
- NextPageLink
- PageLinks
- CurrentPageReport
- RowsPerPageDropdown
- JumpToPageDropdown

Note that {RowsPerPageDropdown} has it's own template, options to display is provided via rowsPerPageTemplate attribute (e.g. rowsPerPageTemplate="9,12,15").

Also {CurrentPageReport} has it's own template defined with currentPageReportTemplate option. You can use {currentPage},{totalPages},{totalRecords},{startRecord},{endRecord} keyword within currentPageReportTemplate. Default is {currentPage} of {totalPages}. Default UI is;

which corresponds to the following template.

```
"{FirstPageLink} {PreviousPageLink} {PageLinks} {NextPageLink} {LastPageLink}"
```

Here are more examples based on different templates;

```
" {CurrentPageReport} {FirstPageLink} {PreviousPageLink} {PageLinks} {NextPageLink} {LastPageLink} {RowsPerPageDropdown}"
```

```
" {PreviousPageLink} {CurrentPageReport} {NextPageLink}"
```

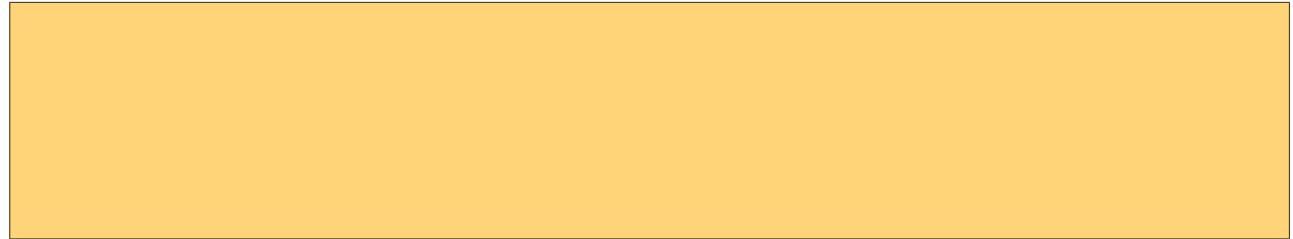

Paginator Position

Paginator can be positioned using *paginatorPosition* attribute in three different locations, "top", "bottom" or "both" (default).

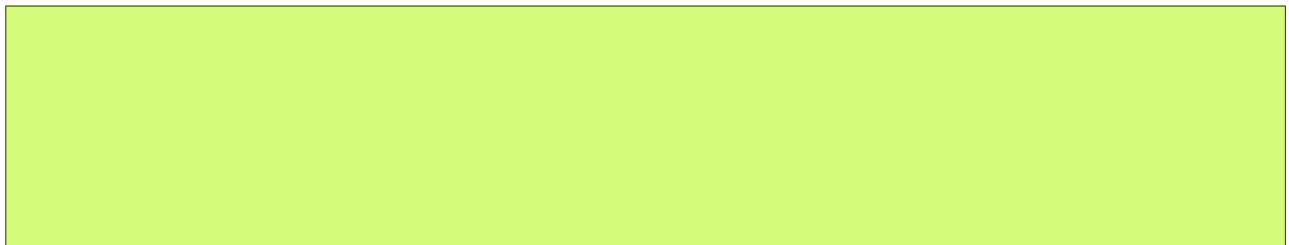

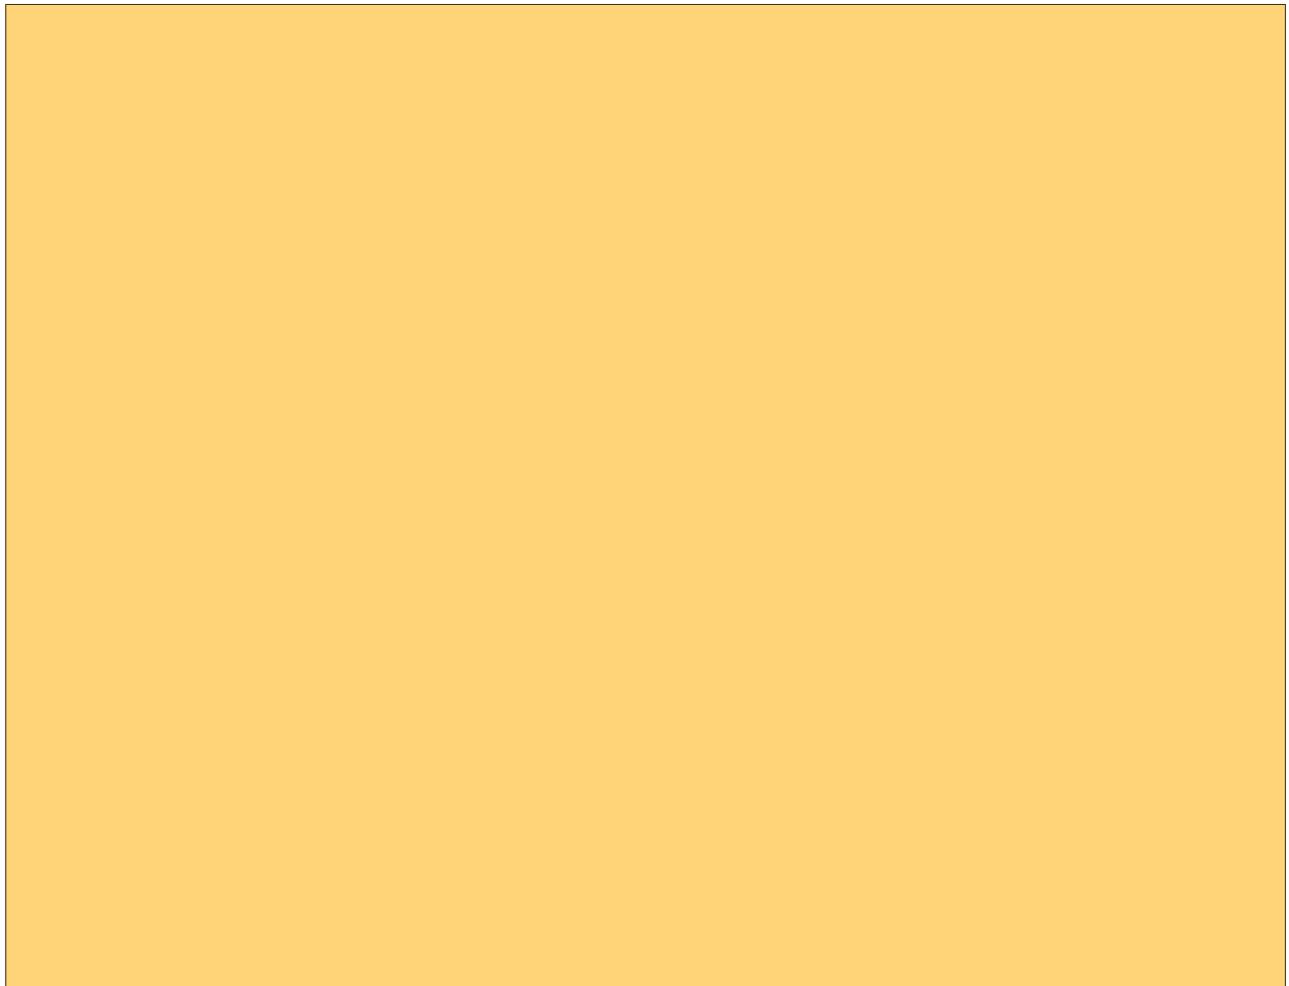

Custom Content in Paginator

Custom content can be placed inside a paginator using a facet name matching a token in the template.

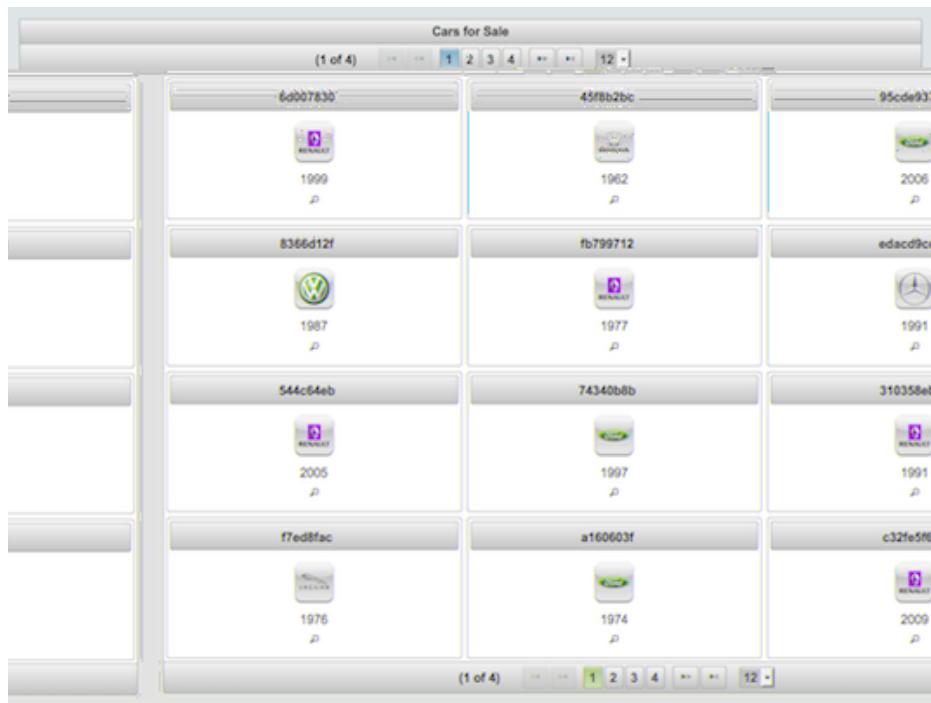

Selecting Data

Selection of data displayed in datagrid is very similar to row selection in datatable, you can access the current data using the var reference. Here is an example to demonstrate how to select data from datagrid and display within a dialog with ajax.

Layout Modes

DataGrid has two layout modes, "tabular" mode uses a table element and "grid" mode uses PrimeFaces Grid CSS to create a responsive ui.

On a smaller screen, grid mode adjusts the content for the optimal view.

Ajax Behavior Events

page	org.primefaces.event.data.PageEvent	On pagination.

”

Client Side API

Widget: *PrimeFaces.widget.DataGrid*

getPaginator()	-	Paginator	Returns the paginator widget.

Skinning

DataGrid resides in a main div container which style and styleClass attributes apply. Following is the list of structural style classes;

.ui-datagrid	Main container element
.ui-datagrid-content	Content container.
.ui-datagrid-data	Table element containing data
.ui-datagrid-row	A row in grid
.ui-datagrid-column	A column in grid

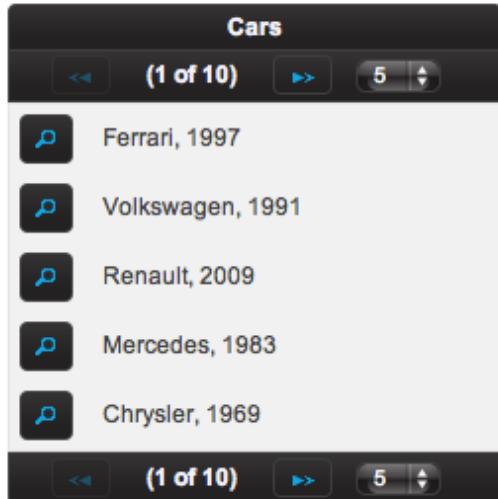

As skinning style classes are global, see the main theming section for more information.

Tips

- DataGrid supports lazy loading data via LazyDataModel, see DataTable lazy loading section.
- DataGrid provides two facets named *header* and *footer* that you can use to provide custom content at these locations.

3.34 DataList

DataList presents a collection of data in list layout with several display types.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Data to display.
var	null	String	Name of the request-scoped variable used to refer each data.
rows	null	Integer	Number of rows to display per page.
first	0	Integer	Index of the first row to be displayed

type	unordered	String	Type of the list, valid values are "unordered", "ordered", "definition" and "none".
itemType	null	String	Specifies the list item type.
widgetVar	null	String	Name of the client side widget.
paginator	false	boolean	Enables pagination.
paginatorTemplate	null	String Boolean	Template of the paginator.
rowsPerPageTemplate	null	String	Template of the rowsPerPage dropdown.
currentPageReportTemplate	null	String	Template of the currentPageReport UI.
pageLinks	10	Integer	Maximum number of page links to display.
paginatorPosition	both	String	Position of the paginator.
paginatorAlwaysVisible	true	Boolean	Defines if the paginator should be hidden if total data count is less than number of rows per page.
style	null	String	Inline style of the main container.
styleClass	Null	String	Style class of the main container.
rowIndexVar	null	String	Name of the iterator to refer each row index.
varStatus	null	String	Name of the exported request scoped variable

Item Type

itemType defines the bullet type of each item. For ordered lists, in addition to commonly used *decimal* type, following item types are available;

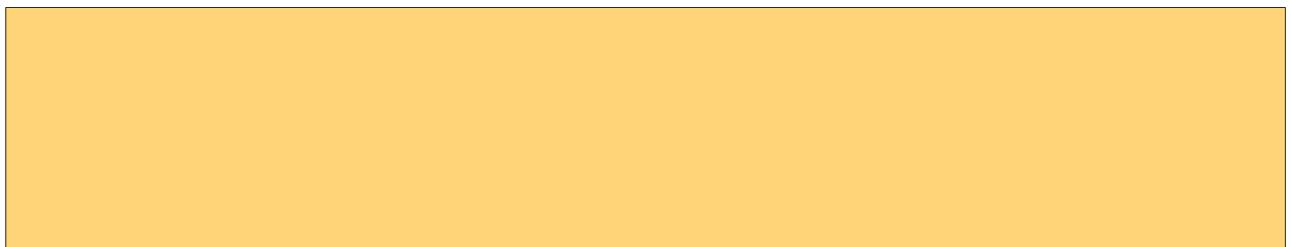

- A
- a
- i

And for unordered lists, available values are;

- disc
- circle
- square

Definition Lists

Third type of dataList is definition lists that display inline description for each item, to use definition list set *type* option to "*definition*". Detail content is provided with the facet called "*description*".

Ajax Pagination

DataList has a built-in paginator that is enabled by setting *paginator* option to true.

Pagination configuration and usage is same as dataGrid, see pagination section in dataGrid documentation for more information and examples.

Ajax Behavior Events

page	org.primefaces.event.data.PageEvent	On pagination.

”

Selecting Data

Data selection can be implemented same as in dataGrid, see selecting data section in dataGrid documentation for more information and an example.

Client Side API

Widget: *PrimeFaces.widget.DataList*

getPaginator()	-	Paginator	Returns the paginator widget.

Skinning

DataList resides in a main div container which style and styleClass attributes apply. Following is the list of structural style classes;

.ui-datalist	Main container element
.ui-datalist-content	Content container
.ui-datalist-data	Data container
.ui-datalist-item	Each item in list

As skinning style classes are global, see the main theming section for more information.

Tips

- DataList supports lazy loading data via LazyDataModel, see DataTable lazy loading section.
- If you need full control over list type markup, set type to “none”. With this setting, datalist does not render item tags like li and behaves like ui:repeat.
- DataList provides two facets named *header* and *footer* that you can use to provide custom content at these locations.

3.35 DataScroller

DataScroller displays a collection of data with on demand loading using scrolling.

Info

value	null	Object	Data to display.
var	null	String	Name of the request-scoped variable used to refer each data.
rows	null	Integer	Number of rows to display per page.
first	0	Integer	Index of the first row to be displayed
widgetVar	null	String	Name of the client side widget.
style	null	String	Inline style of the main container.
styleClass	Null	String	Style class of the main container.
chunkSize	0	int	Number of items to fetch in each load.
rowIndexVar	null	String	Name of iterator to refer each row index.
mode	document	String	Defines the target to listen for scroll event, valid values are "document" (default) and "inline".
scrollHeight	null	String	Defines pixel height of the viewport in inline mode.
lazy	false	Boolean	Defines if lazy loading is enabled for the data component.
buffer	10	Integer	Percentage height of the buffer between the bottom of the page and the scroll position to initiate the load for the new chunk. Value is defined in integer and default is 10 meaning load would happen after 90% of the viewport is scrolled down.

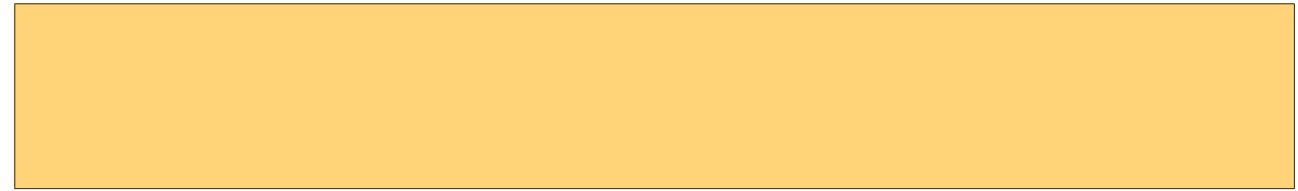

Getting started with the DataScroller

DataScroller requires a collection of data to display, when the page is scrolled down, datascroller will do a request with ajax to fetch the new chunk of data and append them at the bottom.

Scroll Mode

Default element whose scrollbar is monitored is page itself, *mode* option is used to customize the scroll target. Two possible options for the mode attribute are “document” and “inline”. Document mode is default and *inline* mode listens to the scroll event of the datascroller container itself.

Loader

In case of scrolling, a UI element such as button can defined as the loader so that new data is loaded when the loader element is clicked. Loader component is defined using "loader" facet.

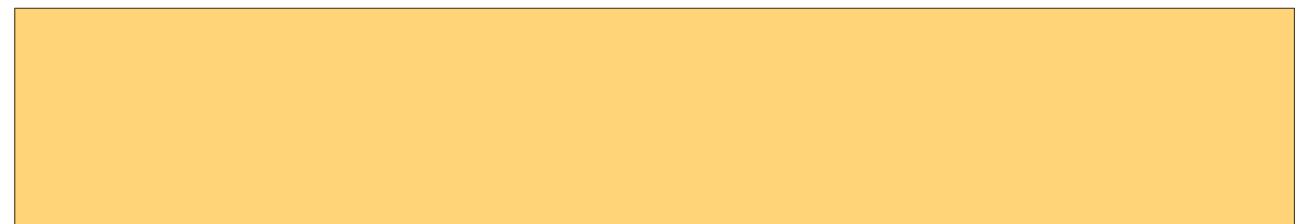

Lazy Loading

Lazy loading is enabled by enabling the lazy attribute and providing a LazyDataModel instance as the value. Refer to lazy load example in DataTable for an example about LazyDataModel.

Header

Header of the component is defined using header facet.

Client Side API

Widget: *PrimeFaces.widget.DataScroller*

load()	-	void	Loads the next chunk.

Skinning

DataScroller resides in a main div container which style and styleClass attributes apply. Following is the list of structural style classes;

.ui-datascroller	Main container element
.ui-datascroller-inline	Main container element in inline mode
.ui-datalist-header	Header element
.ui-datalist-content	Content element
.ui-datascroller-list	List element container
.ui-datascroller-item	Container of each item in the list
.ui-datascroller-loader	Container of custom loader element.
.ui-datascroller-loading	Built-in load status indicator

As skinning style classes are global, see the main theming section for more information.

3.36 DataTable

DataTable displays data in tabular format.

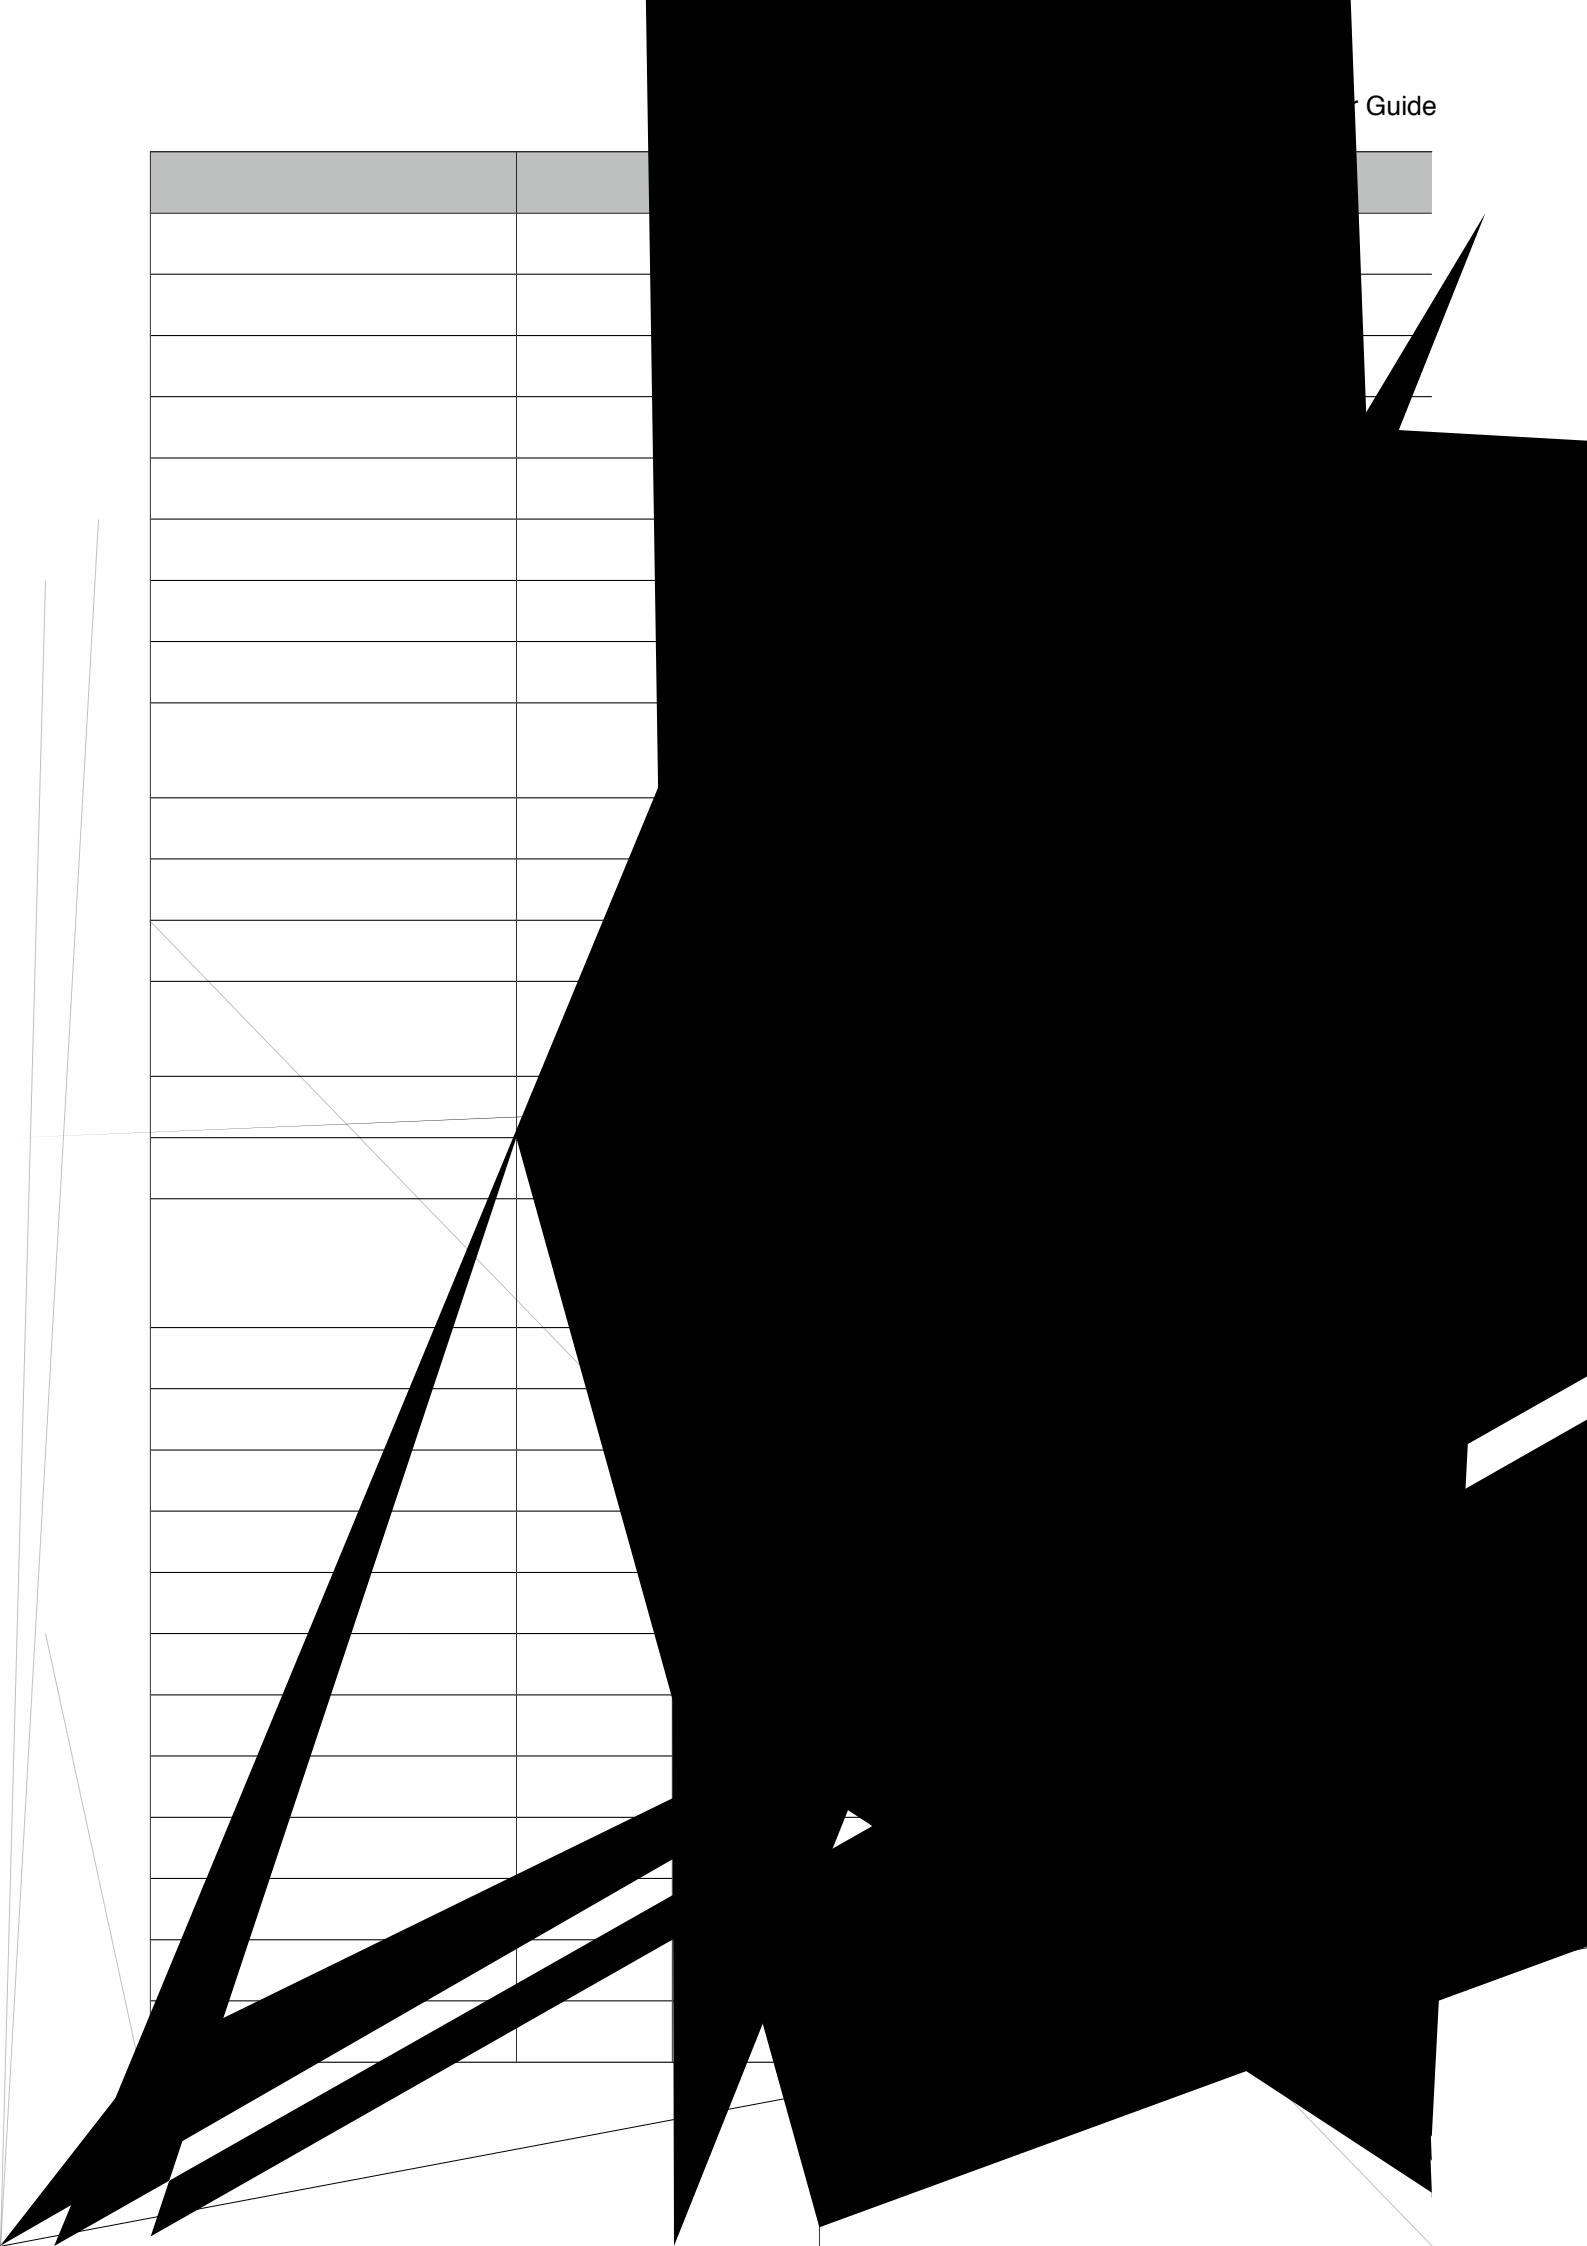

List of Cars			
Model	Year	Manufacturer	Color
fe1c52bb	1968	Volkswagen	Orange
4f95b4f8	1993	BMW	Red
cb9d1d28	2005	Opel	Green
e297b6eb	1980	Volvo	Silver
c67450c1	1971	Volkswagen	Brown
669699ae	2000	Jaguar	Blue
d632787b	1965	Ford	Silver
5d8b24ce	1988	Jaguar	Maroon
814ef317	1970	BMW	Red
d1b57e10	1970	Ford	Red

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	false	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Data to display.
var	null	String	Name of the request-scoped variable used to refer each data.
rows	null	Integer	Number of rows to display per page.
first	0	Integer	Index of the first row to be displayed

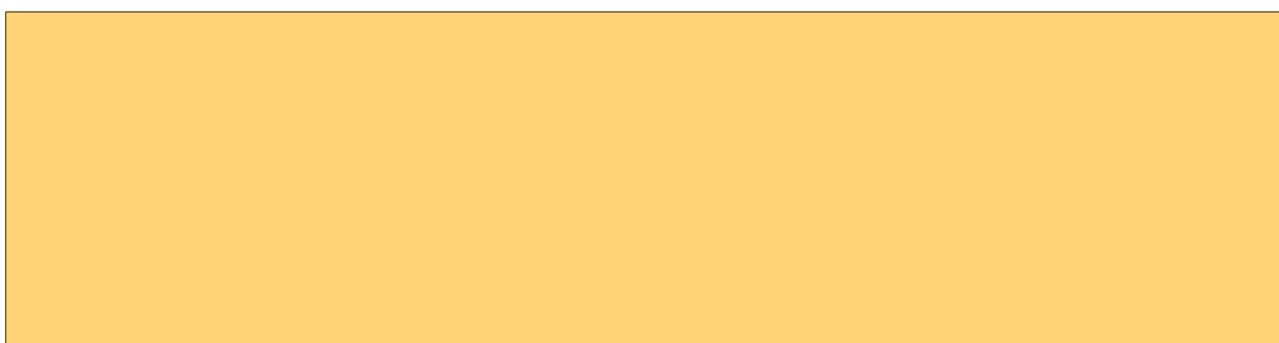

tableStyleClass	null	String	Style class of the table element.
filterEvent	keyup	String	Event to invoke filtering for input filters.
filterDelay	300	Integer	Delay in milliseconds before sending an ajax filter query.
draggableColumns	false	Boolean	Columns can be reordered with dragdrop when enabled.
editable	false	Boolean	Controls incell editing.
lazy	false	Boolean	Controls lazy loading.
filteredValue	null	List	List to keep filtered data.
sortMode	single	String	Defines sorting mode, valid values are <i>single</i> and <i>multiple</i> .
editMode	row	String	Defines edit mode, valid values are <i>row</i> and <i>cell</i> .
editingRow	false	Boolean	Defines if cell editors of row should be displayed as editable or not.
cellSeparator	null	String	Separator text to use in output mode of editable cells with multiple components.
summary	null	String	Summary attribute for WCAG.
frozenRows	null	Object	Collection to display as fixed in scrollable mode.
dir	ltr	String	Defines text direction, valid values are <i>ltr</i> and <i>rtl</i> .
liveResize	false	Boolean	Columns are resized live in this mode without using a resize helper.
stickyHeader	false	Boolean	Sticky header stays in window viewport during scrolling.
expandedRow	false	Boolean	Defines if row should be rendered as expanded by default.
disabledSelection	false	Boolean	Disables row selection when true.
rowSelectionMode	new	String	Defines row selection mode for multiple selection. Valid values are "new", "add" and "checkbox".
rowExpandMode	new	String	Defines row expand mode, valid values are "single" and "multiple" (default).
dataLocale	null	Object	Locale to be used in features such as filtering and sorting, defaults to view locale.
nativeElements	false	Boolean	Uses native radio-checkbox elements for row selection.
frozenColumns	0	Integer	Number of columns to freeze from start index 0.

draggableRows	false	Boolean	When enabled, rows can be reordered using dragdrop.
caseSensitiveSort	false	Boolean	Case sensitivity for sorting, insensitive by default.
skipChildren	false	Boolean	Ignores processing of children during lifecycle, improves performance if table only has output components.
disabledTextSelection	true	Boolean	Disables text selection on row click.
sortField	null	String	Name of the field to pass lazy load method for sorting. If not specified, sortBy expression is used to extract the name.
initMode	load	String	Defines when the datatable is initiated at client side, valid values are "load" (default) and "immediate".
nullSortOrder	1	Integer	Defines where the null values are placed in ascending sort order. Default value is "1" meaning null values are placed at the end in ascending mode and at beginning in descending mode. Set to "-1" for the opposite behavior.
tabindex	null	String	Position of the element in the tabbing order.
reflow	false	Boolean	Reflow mode is a responsive mode to display columns as stacked depending on screen size.
liveScrollBuffer	0	Integer	Percentage height of the buffer between the bottom of the page and the scroll position to initiate the load for the new chunk. Value is defined in integer and default is 0.
rowHover	false	Boolean	Adds hover effect to rows, default is false. Hover is always on when selection is enabled.
rowStatePreserved	false	Boolean	Keeps state of its children on a per-row basis. Default is false.
resizeMode	fit	String	Defines the resize behavior, valid values are "fit" (default) and expand.
ariaRowLabel	null	String	Label to read by screen readers on checkbox selection.
saveOnCellBlur	true	Boolean	Saves the changes in cell editing on blur, when set to false changes are discarded..
clientCache	false	Boolean	Caches the next page asynchronously, default is false.
multiViewState	false	Boolean	Whether to keep table state across views, defaults to false.

filterBy	false	List	List of FilterState objects to filter table by default.
globalFilter	null	String	Value of the global filter to use when filtering by default.
cellEditMode	eager	String	Defines the cell edit behavior, valid values are "eager" (default) and "lazy".
expandableRowGroups	false	Boolean	Makes row groups toggleable, default is false.
virtualScroll	false	Boolean	Loads data on demand as the scrollbar gets close to the bottom. Default is false.

Getting started with the DataTable

We will be using the same Car and CarBean classes described in DataGrid section.

Header and Footer

Both datatable itself and columns can have custom content in their headers and footers using header and footer facets respectively. Alternatively for columns there are headerText and footerText shortcuts to display simple texts.

List of Cars			
Model	Manufacturer	Color	Year
16c9b7c6	Mercedes	Maroon	1979
de0e4475	Volkswagen	Maroon	1994
d17a0cac	Ford	Black	1998
0db0095d	Ford	Red	1983
c09b2d08	Renault	Red	1962
a5e3c203	Volkswagen	Green	2007
196bd9e9	Ford	White	1994
111db4d2	Ford	Silver	1994
73b17bd0	Volvo	Blue	1973
8 digit code			1960–2010
In total there are 9 cars.			

Pagination

DataTable has a built-in ajax based paginator that is enabled by setting paginator option to true, see pagination section in dataGrid documentation for more information about customization options.

Optionally enabling clientCache property loads the next page asynchronously so that when user clicks the second page, data is displayed instantly from client side.

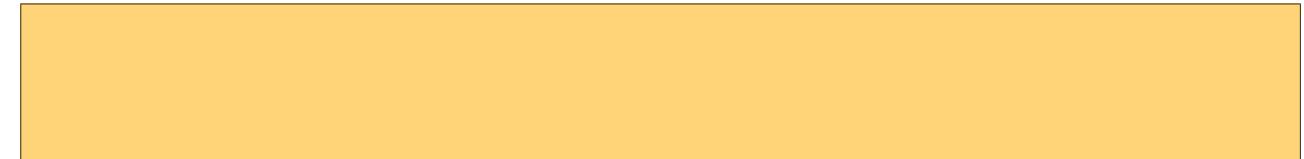

Sorting

Defining *sortBy* attribute enables ajax based sorting on that particular column.

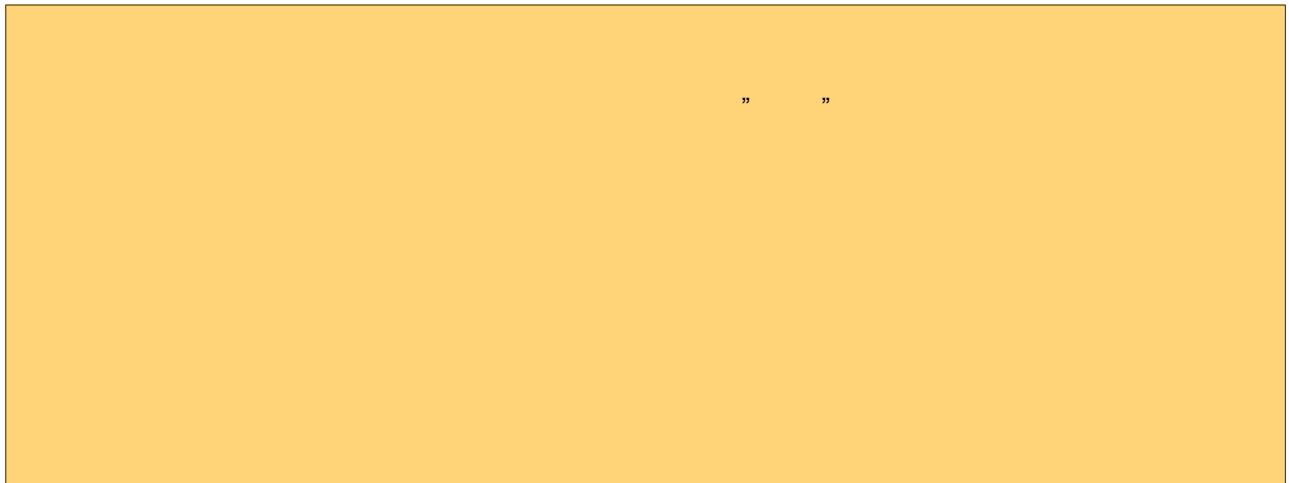

Instead of using the default sorting algorithm which uses a java comparator, you can plug-in your own sort method as well.

Multiple sorting is enabled by setting *sortMode* to *multiple*. In this mode, clicking a sort column while metakey is on adds sort column to the order group.

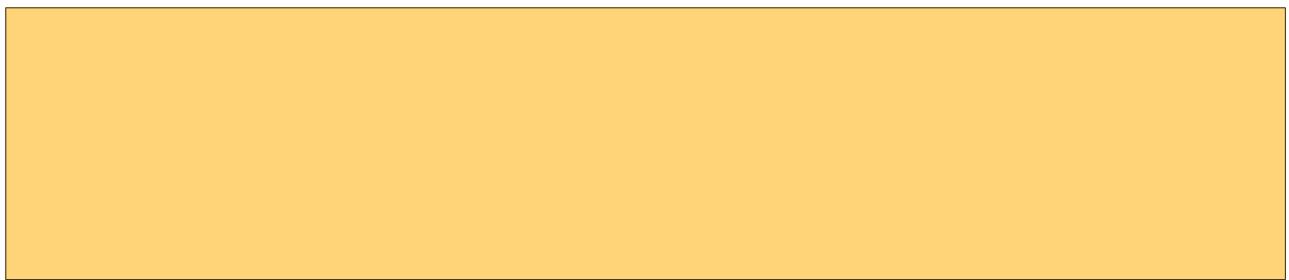

DataTable can display data sorted by default, to implement this use the *sortBy* option of datatable and the optional *sortOrder*. Table below would be initially displayed as sorted by model.

Filtering

Ajax based filtering is enabled by setting *filterBy* at column level and providing a list to keep the filtered sublist. It is suggested to use a scope longer than request like viewscope to keep the *filteredValue* so that filtered list is still accessible after filtering.

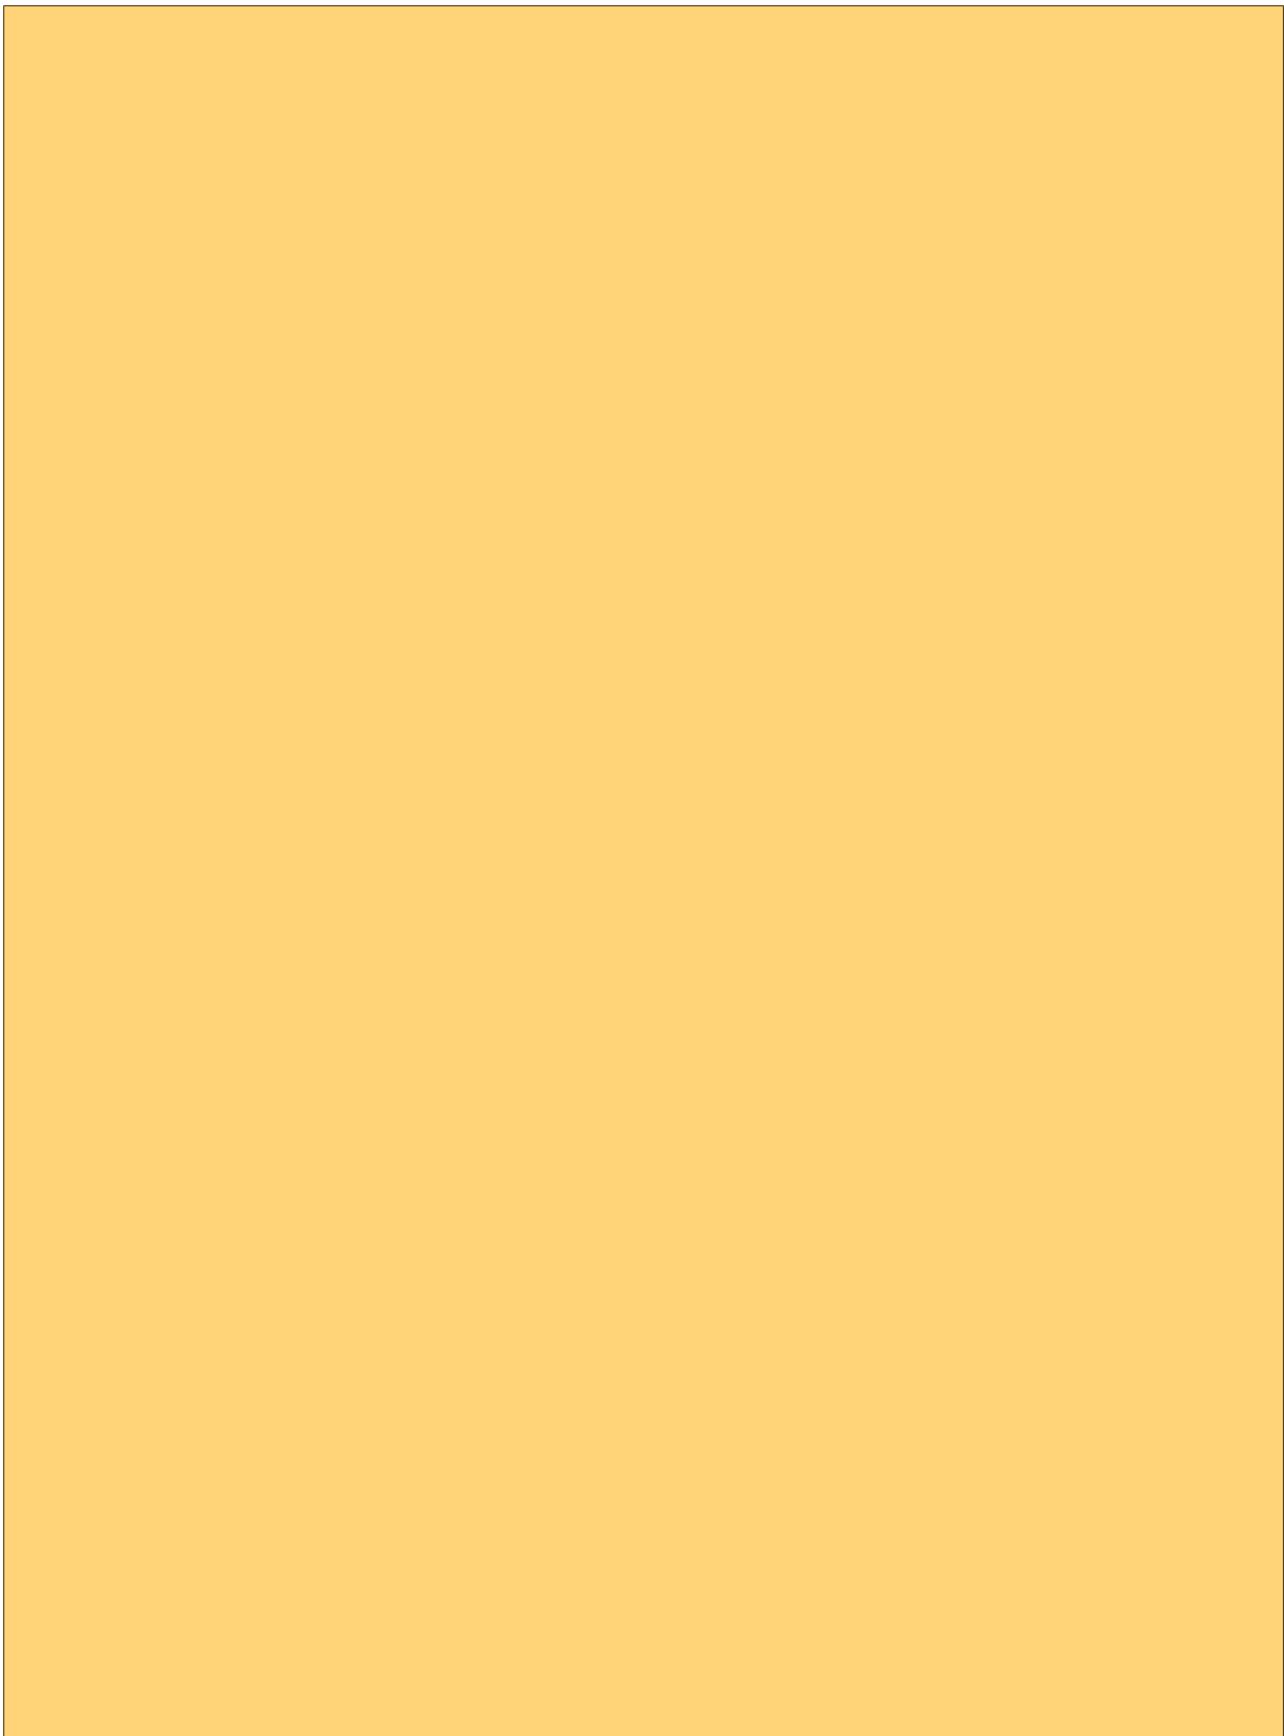

Filtering is triggered with keyup event and filter inputs can be styled using *filterStyle*, *filterStyleClass* attributes. If you'd like to use a dropdown instead of an input field to only allow predefined filter values use *filterOptions* attribute and a collection/array of selectitems as value. In addition, *filterMatchMode* defines the built-in matcher which is *startsWith* by default.

Following is a basic filtering datatable with these options demonstrated;

Filter located at header is a global one applying on all fields, this is implemented by calling client side API method called `filter()`, important part is to specify the id of the input text as `globalFilter` which is a reserved identifier for datatable.

In addition to default filtering with generated elements, custom elements can also be used as a filter facet. Example below uses custom filter components in combination with generated elements. When a custom component is used as a filter facet, filtering needs to be called manually from a preferred event such as `onchange="PF('carsTable').filter()"`. Also defining a converter might be necessary if the value of the filter facet is not defined.

`filterMatchMode` defines which built-in filtering algorithm would be used per column, valid values for this attribute are;

- `:startsWith` : Checks if column value starts with the filter value.
- `:endsWith` : Checks if column value ends with the filter value.
- `:contains` : Checks if column value contains the filter value.
- `:equals` : Checks if string representations of column value and filter value are same.
- `:lt` : Checks if column value is less than the filter value.
- `:lte` : Checks if column value is less than or equals the filter value.
- `:gt` : Checks if column value is greater than the filter value.
- `:gte` : Checks if column value is greater than or equals the filter value.
- `:eq` : Checks if column value equals the filter value.
- `:in` : Checks if column value is in the collection of the filter value.

In case the built-in methods do not suffice, custom filtering can be implemented using `filterFunction` approach.

`filterFunction` should be a method with three parameters; column value, filter value and locale. Return value is a boolean, true accepts the value and false rejects it.

Locale is provided as optional in case you need to use a locale aware method like `toLowerCase(Locale locale)`. Note that String based filters like `startsWith`, `endsWith` uses `toLowerCase` already and `dataLocale` attribute is used to provide the locale to use when filtering.

Row Selection

There are several ways to select row(s) from datatable. Let's begin by adding a Car reference for single selection and a Car array for multiple selection to the CarBean to hold the selected data.

Single Selection with a Command Component

This method is implemented with a command component such as `commandLink` or `commandButton`. Selected row can be set to a server side instance by passing as a parameter if you are using EL 2.2 or using `f:setPropertyActionListener`.

Single Selection with Row Click

Previous method works when the button is clicked, if you'd like to enable selection wherever the row is clicked, use *selectionMode* option.

Multiple Selection with Row Click

Multiple row selection is similar to single selection but selection should reference an array or a list of the domain object displayed and user needs to use press modifier key(e.g. ctrl) during selection *.

Single Selection with RadioButton

Selection a row with a radio button placed on each row is a common case, datatable has built-in support for this method so that you don't need to deal with h:selectOneRadios and low level bits. In order to enable this feature, define a column with *selectionMode* set as single.

Multiple Selection with Checkboxes

Similar to how radio buttons are enabled, define a selection column with a multiple selectionMode. DataTable will also provide a selectAll checkbox at column header.

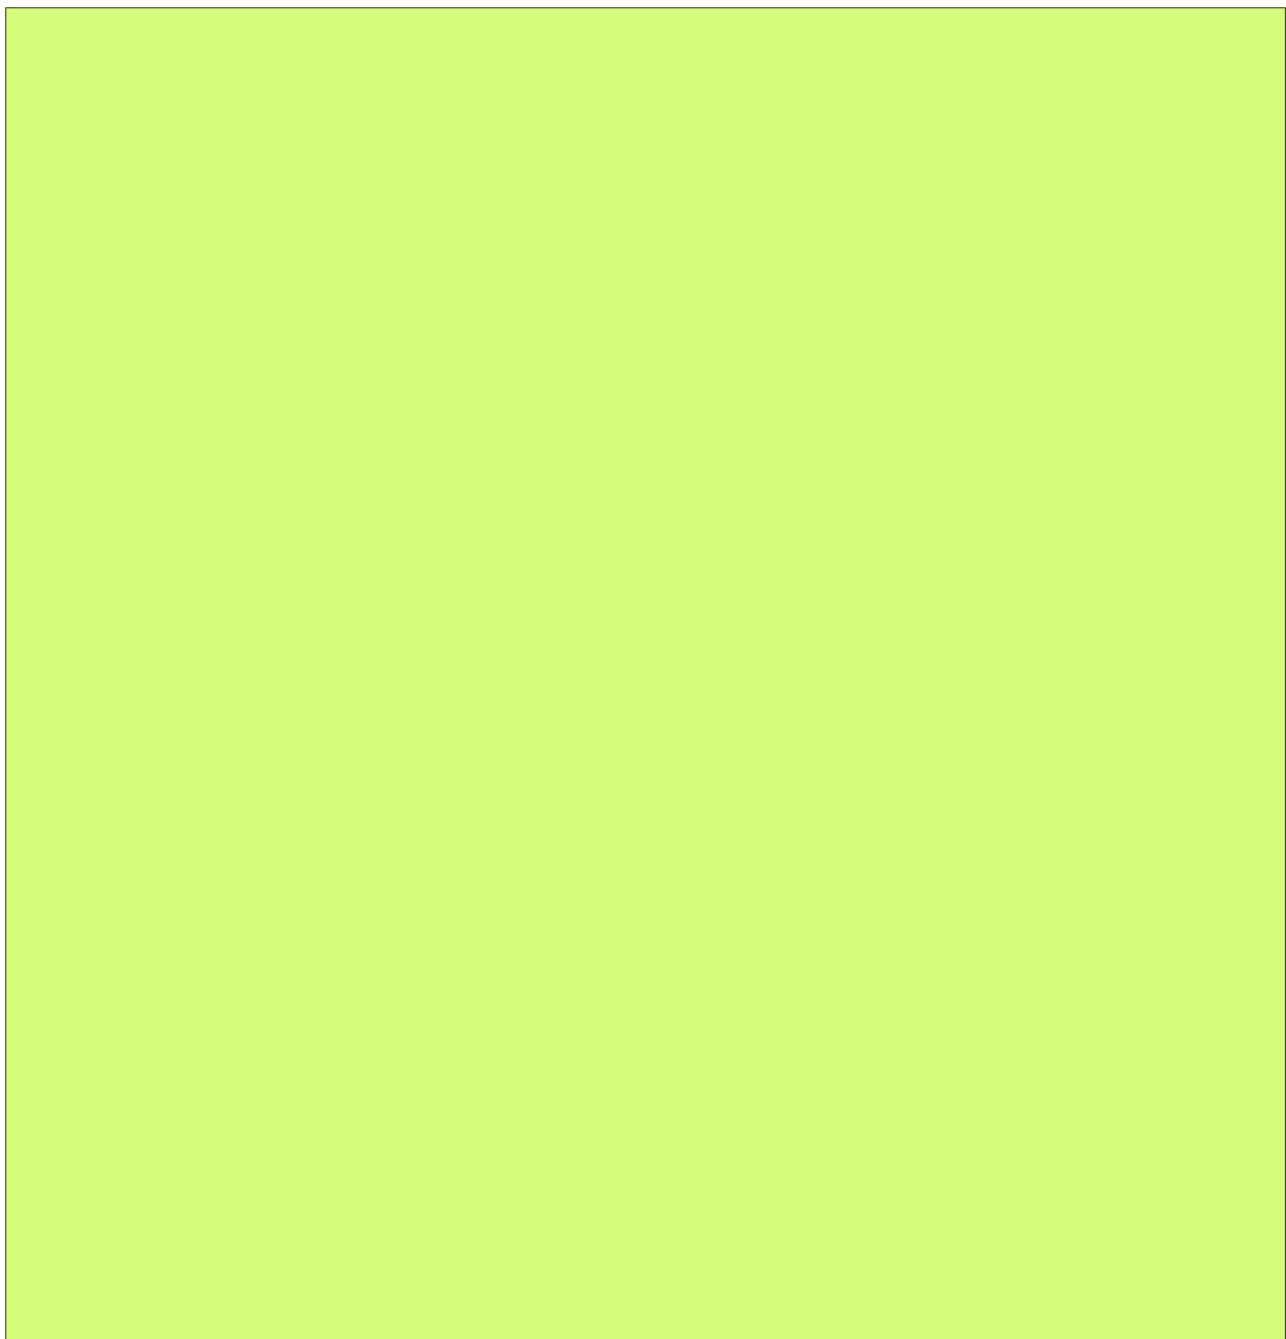

* Use `rowKeyMode` option to customize the default behavior on row click of a multiple selection enabled datatable. Default value is "new" that clears previous selections, "add" mode keeps previous selections same as selecting a row with mouse click when metakey is on and "checkbox" mode allows row selection with checkboxes only.

RowKey

RowKey should a unique identifier from your data model and used by datatable to find the selected rows. You can either define this key by using the `rowKey` attribute or by binding a data model which implements `org.primefaces.model.SelectableDataModel`.

Dynamic Columns

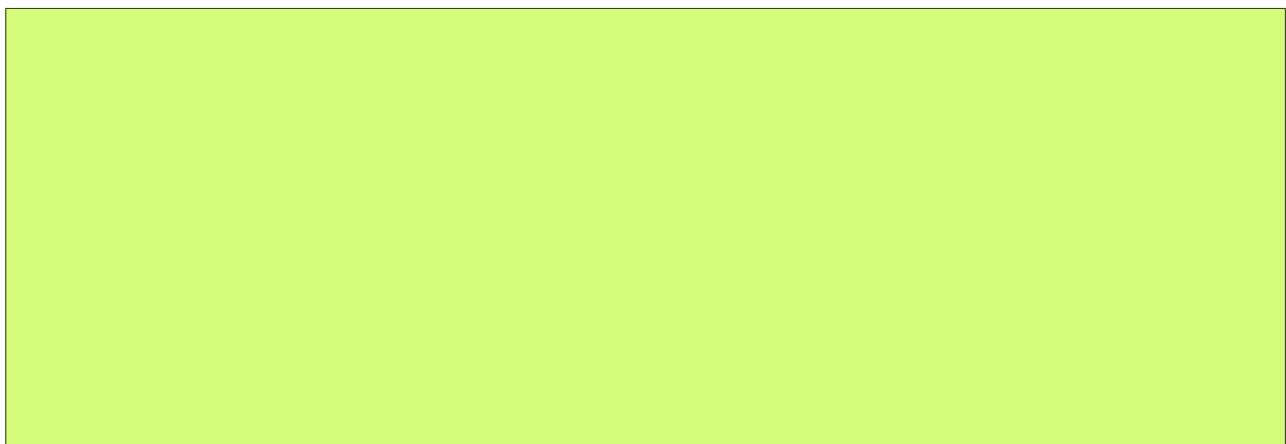

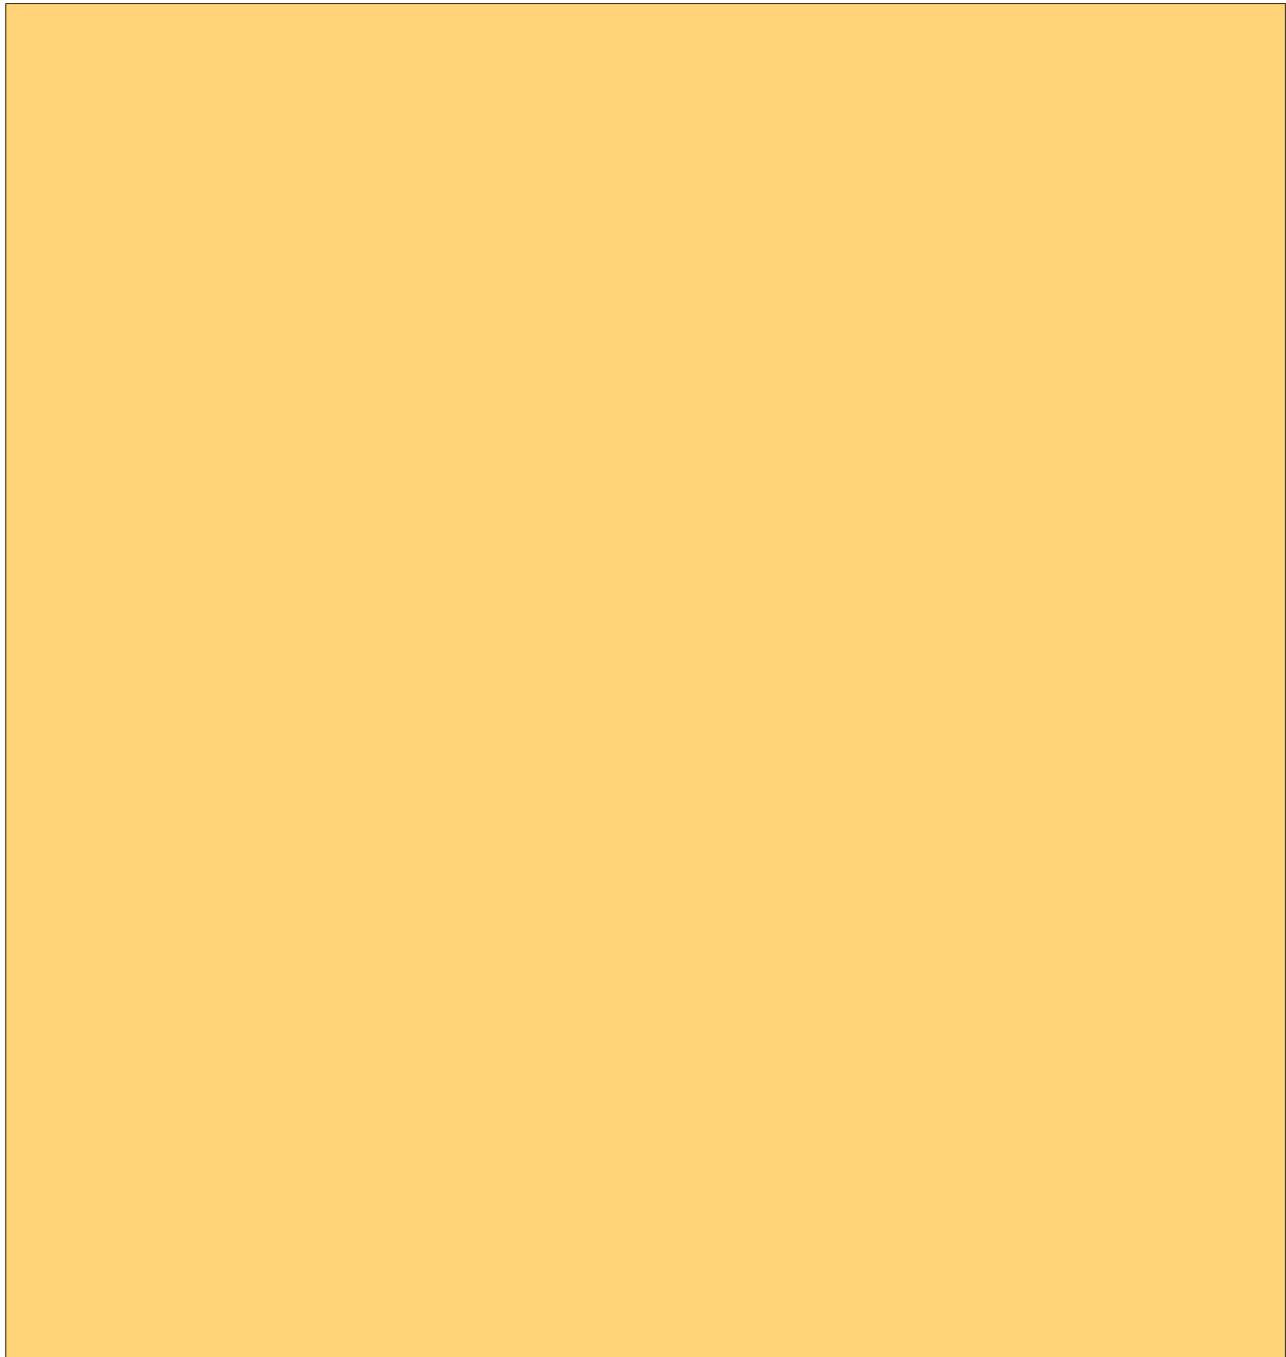

Dynamic columns is handy in case you can't know how many columns to render. Columns component is used to define the columns programmatically. It requires a collection as the value, two iterator variables called `var` and `columnIndexVar`.

Column Grouping

Grouping is defined by ColumnGroup component used to combine datatable header and footers.

Manufacturer	Sales			
	Sales Count		Profit	
	Last Year	This Year	Last Year	This Year
Mercedes	90%	8%	28031\$	25102\$
BMW	14%	91%	18640\$	28023\$
Volvo	82%	24%	130\$	77724\$
Audi	7%	40%	2272\$	33672\$
Renault	10%	54%	98115\$	40664\$
Opel	63%	28%	10549\$	93746\$
Volkswagen	67%	38%	38242\$	19063\$
Chrysler	40%	63%	10146\$	7697\$
Ferrari	26%	70%	40384\$	62298\$
Ford	14%	94%	96052\$	42233\$
Totals:		342561\$	430222\$	

For frozen columns, use *frozenHeader*, *frozenFooter*, *scrollableHeader* and *scrollableFooter* types.

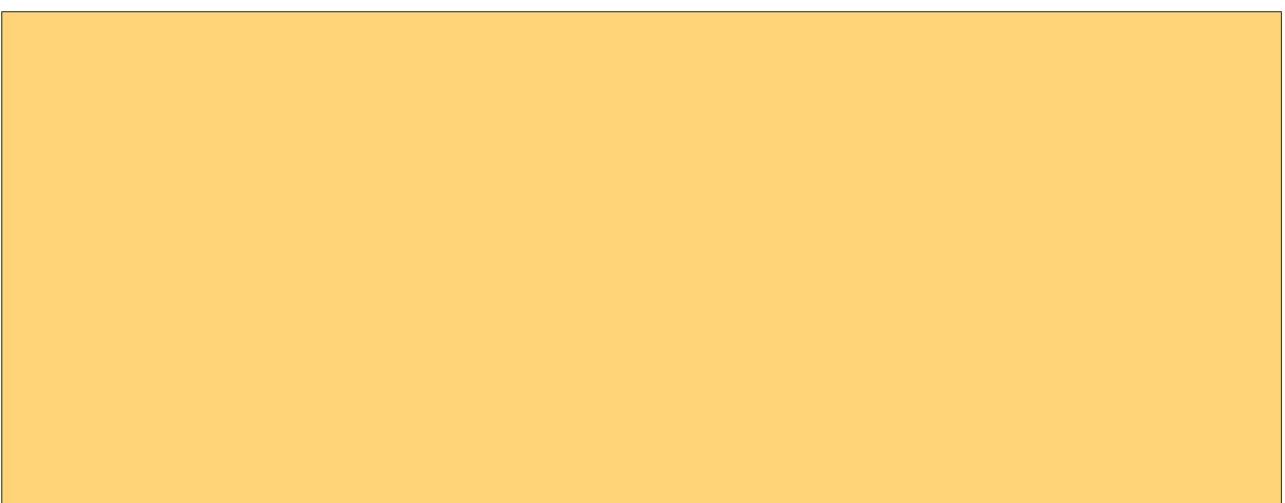

Row Grouping

Rows can be grouped in two ways, using headerRow, summaryRow components or with groupRow attribute on a column.

Optionally rows can be made toggleable using *expandableRowGroups* property.

Alternative approach is using row spans where a row can group multiple rows within the same group. To enable this method, set groupRow to true on the grouping column.

Scrolling

Scrolling makes the header-footer of the table fixed and the body part scrollable. Scrolling is enabled using *scrollable* property and has 3 modes; x, y and x-y scrolling that are defined by *scrollHeight* and *scrollWidth*. These two scroll attributes can be specified using integer values indicating fixed pixels or percentages relative to the container dimensions.

Model	Year	Manufacturer	Color
069794d7	1991	Volvo	Silver
4aeeec6c	1993	Ford	Green
09cbc05c	1983	Chrysler	Maroon
2d374a04	1964	Ferrari	Red
9c09bc54	1987	Volkswagen	Blue
25d45a08	1993	Opel	White

Model	Year	Year	Year
069794d7	1991	1993	1983

Simple scrolling renders all data to client whereas virtual scrolling combined with lazy loading is useful to deal with huge data, in this case data is fetched on-demand. Set *virtualScroll* to enable this option and provide LazyDataModel;

Model	Year	Year	Year
069794d7	1991	1993	1983

Frozen Rows

Certain rows can be fixed in a scrollable table by using the *frozenRows* attribute that defines the number of rows to freeze from the start.

Model	Year	Year	Year
069794d7	1991	1993	1983
4aeeec6c	1993	1983	1964

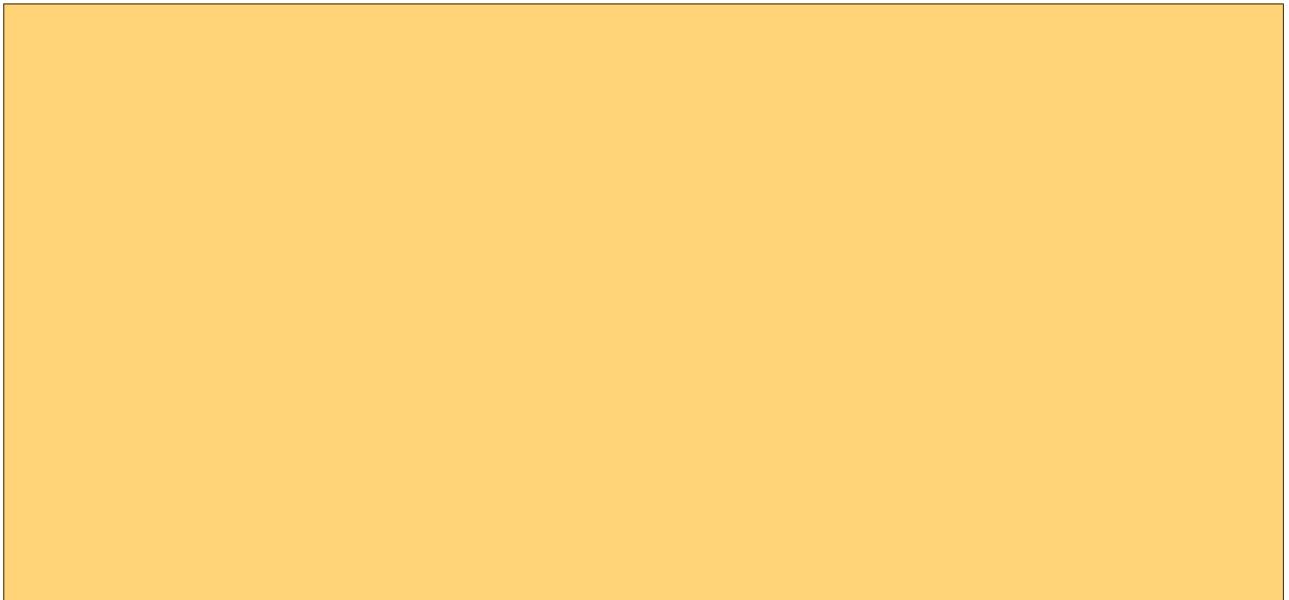

Frozen Columns

Specific columns can be fixed while the rest of them remain as scrollable. *frozenColumns* defines the number of columns to freeze from the start.

Expandable Rows

RowToggler and *RowExpansion* facets are used to implement expandable rows.

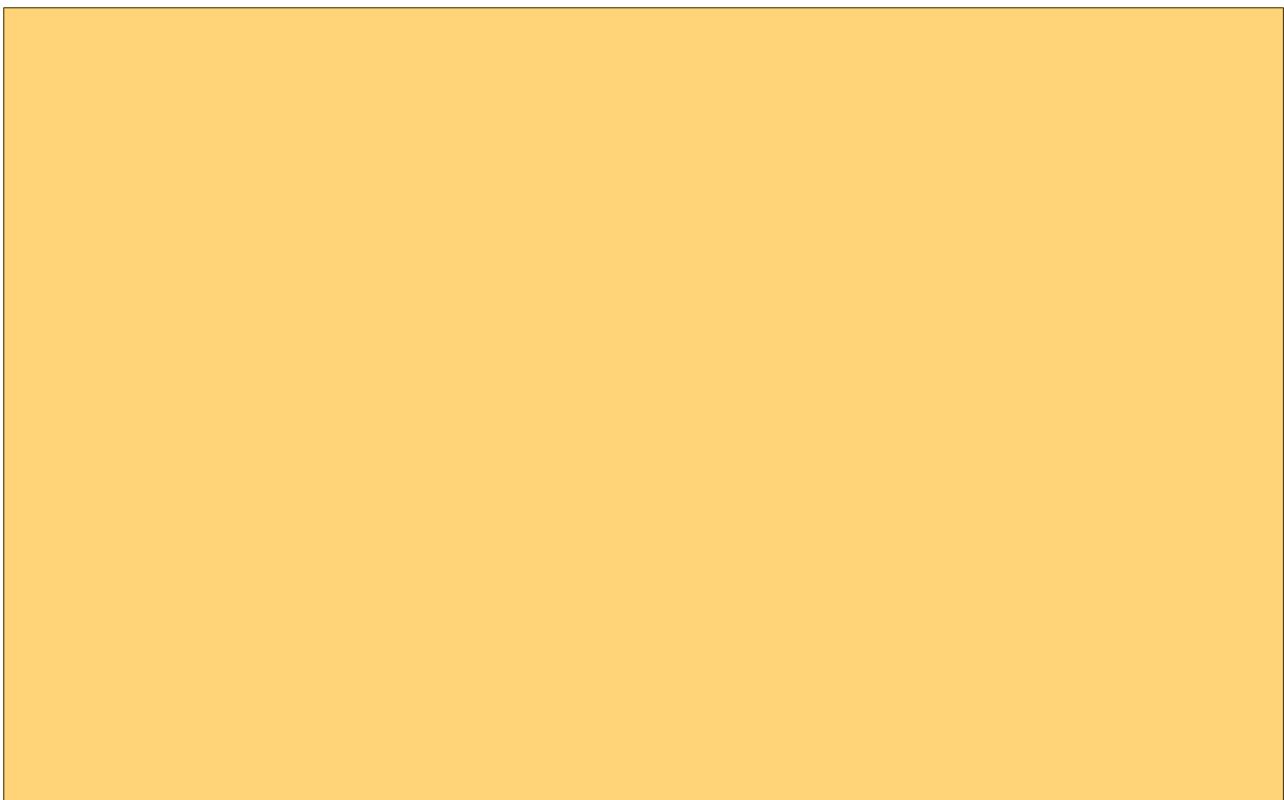

p:rowToggler component places an expand/collapse icon, clicking on a collapsed row loads expanded content with ajax. If you need to display a row as expanded by default, use *expandedRow* attribute which is evaluated before rendering of each row so value expressions are supported. Additionally, *rowExpandMode* attribute defines if multiple rows can be expanded at the same time or not, valid values are "single" and "multiple" (default).

Expand rows to see detailed information		
	Model	Year
	0b8313c2	1976
	2be34a8c	1995
	08e342c4	2004
	b5d03231	1998
<div style="border: 1px solid #ccc; padding: 5px; width: fit-content;"> Model: b5d03231 Year: 1998 Manufacturer: Mercedes Color: Red </div>		
	b50b6dcc	1974
	db39801c	1995
	f76c474f	1989
	2c9b67a2	2005
	94fb553f	1973

Editing

Incell editing provides an easy way to display editable data. *p:cellEditor* is used to define the cell editor of a particular column. There are two types of editing, *row* and *cell*. Row editing is the default mode and used by adding a *p:rowEditor* component as row controls.

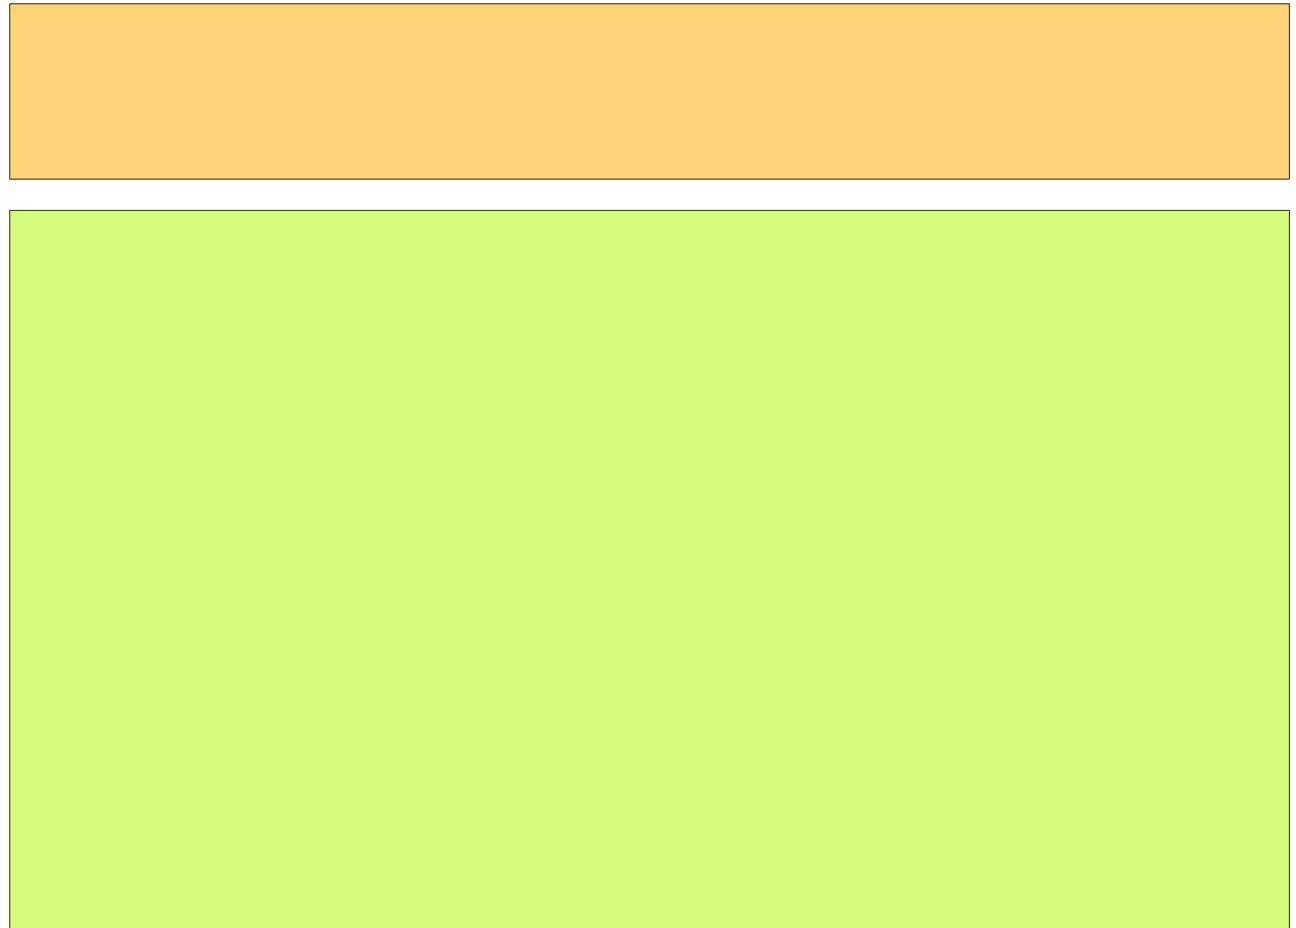

In-Cell Editing				
Model	Year	Manufacturer	Color	Options
824641ad	1976	Volvo	Yellow	⠇
a9bf1625	1961	Volkswagen	Orange	⠇
d859a7ba	1977	Ferrari	Brown	⠇
9379f6f5	1961	Renault	Silver	✓ ✕
744a8017	1960	Chrysler	Silver	⠇
80feefe5	2000	Opel	Yellow	⠇
9e0c7267	1982	Opel	Red	⠇
33124250	1984	Ford	Red	⠇
0349899f	1977	Renault	Red	⠇

When pencil icon is clicked, row is displayed in editable mode meaning input facets are displayed and output facets are hidden. Clicking tick icon only saves that particular row and cancel icon reverts the changes, both options are implemented with ajax interaction.

Another option for incell editing is cell editing, in this mode a cell switches to edit mode when it is clicked, losing focus triggers an ajax event to save the change value.

Lazy Loading

Lazy Loading is an approach to deal with huge datasets efficiently, regular ajax based pagination works by rendering only a particular page but still requires all data to be loaded into memory. Lazy loading datatable renders a particular page similarly but also only loads the page data into memory not the whole dataset. In order to implement this, you'd need to bind a `org.primefaces.model.LazyDataModel` as the value and implement `load` method and enable `lazy` option. Also it is required to implement `getRowData` and `getRowKey` if you have selection enabled.

DataTable calls your load implementation whenever a paging, sorting or filtering occurs with following parameters;

- first: Offset of first data to start from
- pageSize: Number of data to load
- sortField: Name of sort field
- sortOrder: SortOrder enum.
- filter: Filter map with field name as key (e.g. "model" for filterBy="#{car.model}") and value.

In addition to load method, totalRowCount needs to be provided so that paginator can display itself according to the logical number of rows to display.

It is suggested to use *field* attribute of column component to define the field names passed as sortField and filterFields, otherwise these fields would be tried to get extracted from the value expression which is not possible in cases like composite components.

Sticky Header

Sticky Header feature makes the datatable header visible on page scrolling.

Model	Year	Manufacturer	Color
d975132e	2006	Volvo	White

49d09cbd	Silver	1963

Columns

Model

Manufacturer

Color

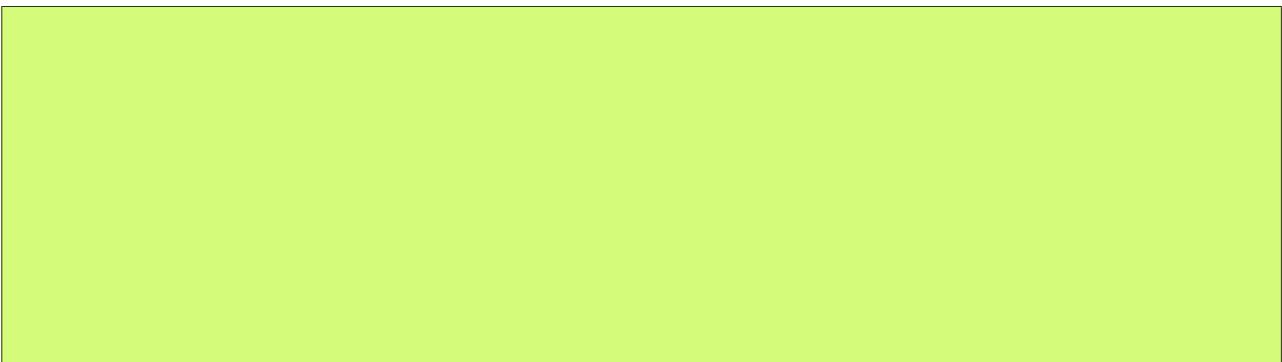

Year

Reordering Rows

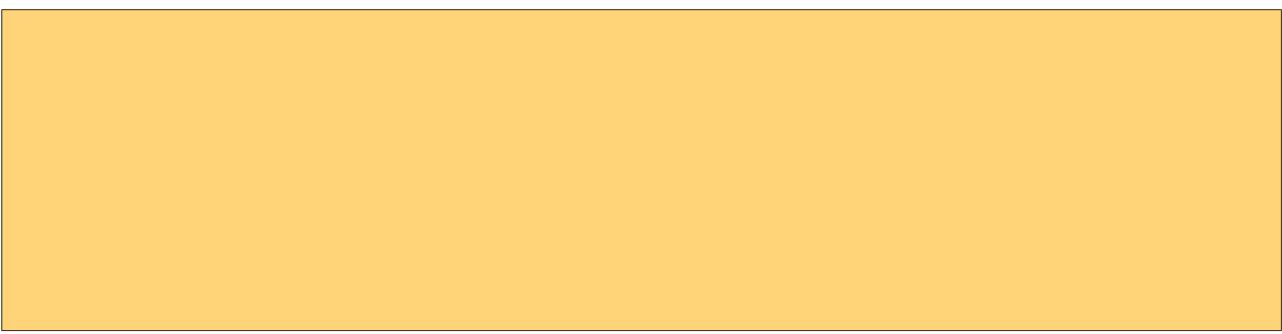

Rows of the table can be reordered using drag&drop. Set `draggableRows` attribute to true to enable this feature.

Optional `rowReorder` ajax behavior is provided to listen to reorder events at server side. Listener of this behavior gets an `org.primefaces.event.ReorderEvent` as a parameter that gives the past and current index of the row being moved.

Reordering Columns

Columns of the table can be reordered using drag&drop as well. Set `draggableColumns` attribute to true to enable this feature. Optional `colReorder` ajax behavior is provided to listen to reorder events at server side.

Responsive DataTable

DataTable has two responsive modes; priority and reflow. In priority mode, responsiveness is based on column priorities that vary between 1 and 6. Lower value means higher priority. On the other hand in reflow mode that is enabled by setting `reflow` to true, all columns will be visible but displayed as stacked.

Ajax Behavior Events

page	org.primefaces.event.data.PageEvent	On pagination.
sort	org.primefaces.event.data.SortEvent	When a column is sorted.
filter	org.primefaces.event.data.FilterEvent	On filtering.
rowSelect	org.primefaces.event.SelectEvent	When a row is being selected.
rowUnselect	org.primefaces.event.UnselectEvent	When a row is being unselected.
rowEdit	org.primefaces.event.RowEditEvent	When a row is edited.
rowEditInit	org.primefaces.event.RowEditEvent	When a row switches to edit mode
rowEditCancel	org.primefaces.event.RowEditEvent	When row edit is cancelled.
colResize	org.primefaces.event.ColumnResizeEvent	When a column is being selected.
toggleSelect	org.primefaces.event.ToggleSelectEvent	When header checkbox is toggled.
colReorder	-	When columns are reordered.
rowSelectRadio	org.primefaces.event.SelectEvent	Row selection with radio.
rowSelectCheckbox	org.primefaces.event.SelectEvent	Row selection with checkbox.
rowUnselectCheckbox	org.primefaces.event.UnselectEvent	Row unselection with checkbox.
rowDblselect	org.primefaces.event.SelectEvent	Row selection with double click.
rowToggle	org.primefaces.event.ToggleEvent	Row expand or collapse.
contextMenu	org.primefaces.event.SelectEvent	ContextMenu display.
cellEdit	org.primefaces.event.CellEditEvent	When a cell is edited.
cellEditInit	org.primefaces.event.CellEditEvent	When a cell edit begins.
cellEditCancel	org.primefaces.event.CellEditEvent	When a cell edit is cancelled e.g. with escape key
rowReorder	org.primefaces.event.ReorderEvent	On row reorder.

For example, datatable below makes an ajax request when a row is selected with a click on row.

Moreover `org.primefaces.event.data.PostSortEvent`, `org.primefaces.event.data.PostFilterEvent` and `org.primefaces.event.data.PostPageEvent`, are available to be used with `f:event` tag.

Client Side API

Widget: `PrimeFaces.widget.DataTable`

<code>getPaginator()</code>	-	<code>Paginator</code>	Returns the paginator instance.
<code>clearFilters()</code>	-	<code>void</code>	Clears all column filters
<code>getSelectedRowsCount()</code>		<code>Number</code>	Returns number of selected rows.
<code>selectRow(r, silent)</code>	<i>r</i> : number or tr element as jQuery object, <i>silent</i> : flag to fire row select ajax behavior	<code>void</code>	Selects the given row.
<code>unselectRow(r, silent)</code>	<i>r</i> : number or tr element as jQuery object, <i>silent</i> : flag to fire row select ajax behavior	<code>void</code>	Unselects the given row.
<code>unselectAllRows()</code>	-	<code>void</code>	Unselects all rows.
<code>toggleCheckAll()</code>	-	<code>void</code>	Toggles header checkbox state.
<code>filter()</code>	-	<code>Void</code>	Filters the data.
<code>selectAllRows()</code>	-	<code>void</code>	Select all rows.
<code>selectAllRowsOnPage()</code>	-	<code>void</code>	Select all rows on current page.
<code>unselectAllRowsOnPage()</code>	-	<code>void</code>	Unselect all rows on current page.

Skinning

DataTable resides in a main container element which `style` and `styleClass` options apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

<code>.ui-datatable</code>	Main container element
<code>.ui-datatable-data</code>	Table body
<code>.ui-datatable-empty-message</code>	Empty message row
<code>.ui-datatable-header</code>	Table header
<code>.ui-datatable-footer</code>	Table footer
<code>.ui-sortable-column</code>	Sortable columns
<code>.ui-sortable-column-icon</code>	Icon of a sortable icon
<code>.ui-expanded-row-content</code>	Content of an expanded row

.ui-row-toggler	Row toggler for row expansion
.ui-editable-column	Columns with a cell editor
.ui-cell-editor	Container of input and output controls of an editable cell
.ui-cell-editor-input	Container of input control of an editable cell
.ui-cell-editor-output	Container of output control of an editable cell
.ui-datable-even	Even numbered rows
.ui-datable-odd	Odd numbered rows
.ui-datable-scrollable	Main container element of a scrollable table.
.ui-datable-scrollable-header	Header wrapper of a scrollable table.
.ui-datable-scrollable-header-box	Header container of a scrollable table.
.ui-datable-scrollable-body	Body container of a scrollable table.
.ui-datable-scrollable-footer	Footer wrapper of a scrollable table.
.ui-datable-scrollable-footer-box	Footer container of a scrollable table.
.ui-datable-resizable	Main container element of a resizable table.
.ui-datable-frozencolumn	Frozen columns.

3.37 DefaultCommand

Which command to submit the form with when enter key is pressed a common problem in web apps not just specific to JSF. Browsers tend to behave differently as there doesn't seem to be a standard and even if a standard exists, IE probably will not care about it. There are some ugly workarounds like placing a hidden button and writing javascript for every form in your app. DefaultCommand solves this problem by normalizing the command(e.g. button or link) to submit the form with on enter key press.

Info

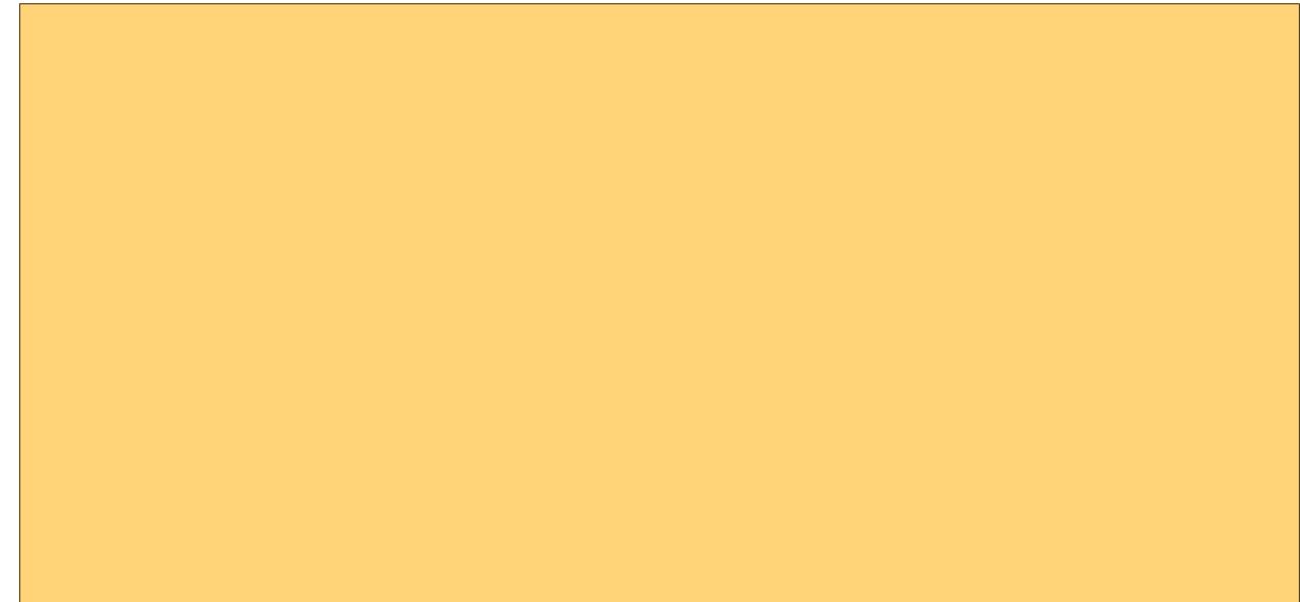

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget
target	null	String	Identifier of the default command component.
scope	null	String	Identifier of the ancestor component to enable multiple default commands in a form.

Getting Started with the DefaultCommand

DefaultCommand must be nested inside a form requires *target* option to reference a clickable command. Example below triggers *btn2* when enter key is pressed. Note that an input must have focused due to browser nature.

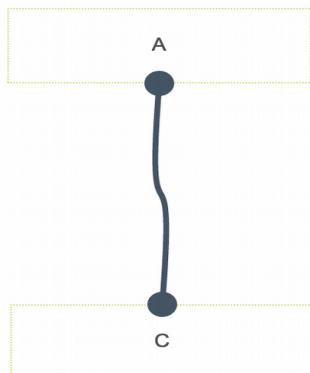

Scope

If you need multiple default commands on same page use scope attribute that refers to the ancestor component of the target input.

3.38 Diagram

Diagram is generic component to create visual elements and connect them on a web page. SVG is used on modern browsers and VML on IE 8 and below. Component is highly flexible in terms of api, events and theming.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget
value	null	String	Model of the diagram.
converter	null	Converter /String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id.

style	null	String	Inline style of the diagram.
styleClass	null	String	Style class of the diagram.

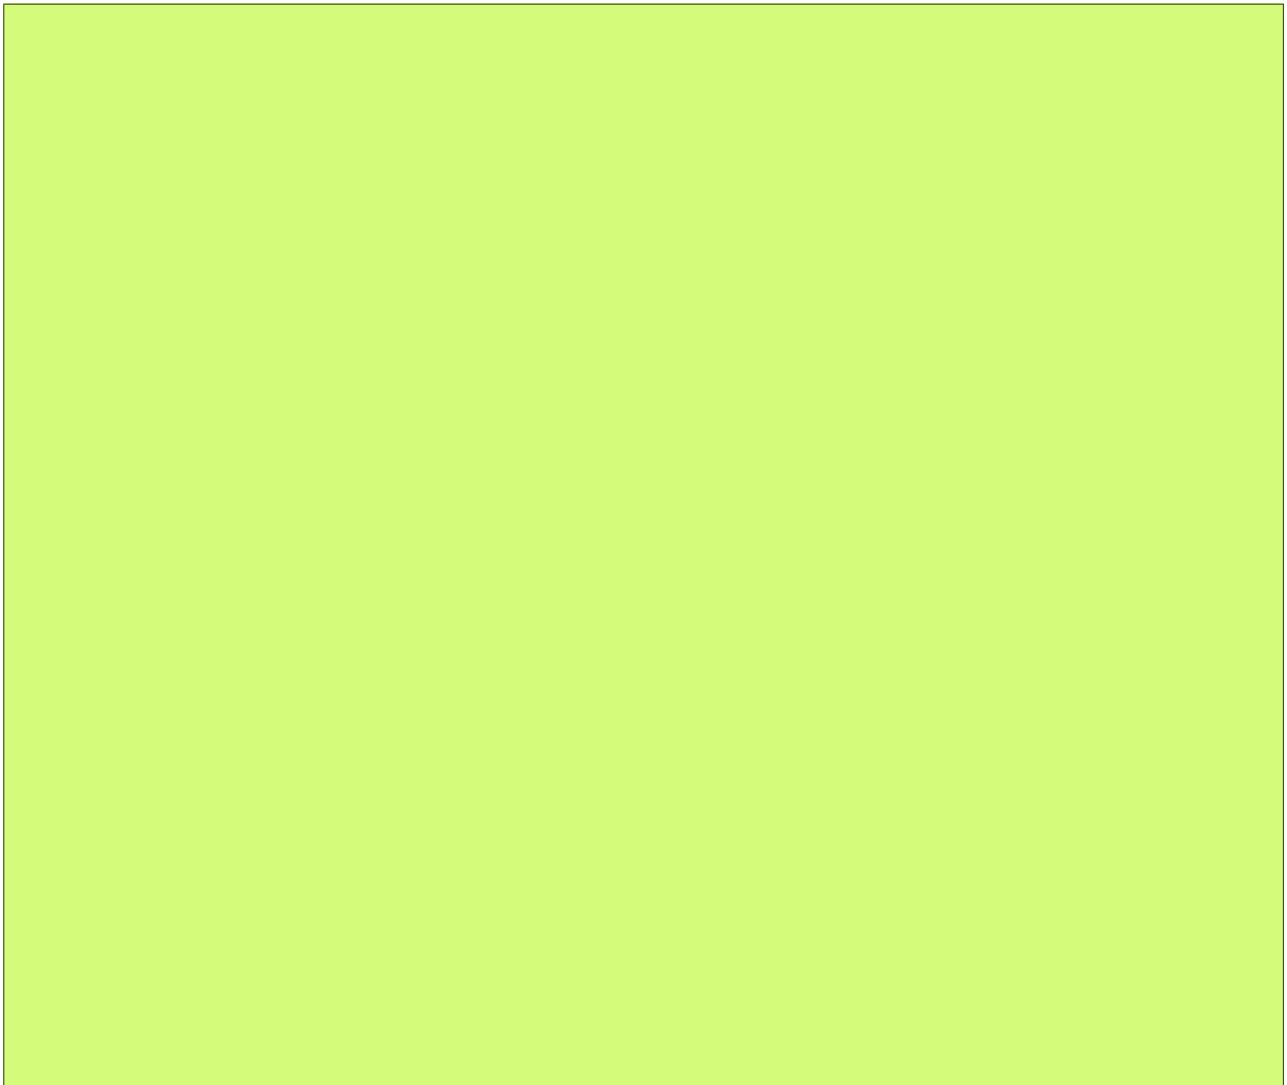

Getting started with the Diagram

Diagram requires a backend model to display.

There are various concepts in diagram model;

- Element: Main type to be connected.
- EndPoint: Ports of elements to be used in connection.
- Connector: Connector to join elements.
- Overlay: Decorators over connectors and endpoints.

In diagram above, there are 3 elements each having endpoints of dot type. After adding them to the model, 2 connections are made, first one being A to B and second one from A to C.

Elements

Elements are the main part of diagram. Styling is done with css and positioning can be done using model. An element should have at least width and height defined to be displayed on page. They can be styled globally using .ui-diagram-element style class or individually using the styleClass property on DiagramElement class.

EndPoints

EndPoints are the ports available on an element that can be used for connections. An endpoint has a location defined by EndPointAnchor. Anchors can be static like "TopLeft" or dynamic like "AutoDefault". There are 4 types of EndPoints differentiated by their shapes;

- BlankEndPoint
- DotEndPoint
- RectangleEndPoint
- ImagEndPoint

An endpoint is added to an element using addEndPoint api;

Connections

A connection requires two endpoints, connector and optional decorators like overlays. There are four connector types;

- Bezier
- FlowChart
- Straight
- StateMachine

Default is bezier and it can be customized using default connector method globally in model or at connection level.

Global

Per Connection

Overlays

Overlays are decorators for connectors and endpoints. Available ones are;

- ArrowOverlay
- DiamondOverlay
- LabelOverlay

Example below adds label and arrow for the connector;

Dynamic Diagrams

A diagram can be edited after being initialized, to create new connections an element should be set as source and to receive new connections it should be a target. Ajax event callbacks such as "connect", "disconnect" and "connectionChange" are available.

Ajax Behavior Events

Diagram provides ajax behavior event callbacks invoked by interactive diagrams.

connect	org.primefaces.event.diagram.ConnectEvent	On new connection.
disconnect	org.primefaces.event.diagram.DisconnectEvent	When a connection is removed.
connectionChange	org.primefaces.event.diagram.ConnectionChangeEvent	When a connection has changed.

3.39 Dialog

Dialog is a panel component that can overlay other elements on page.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>widgetVar</code>	null	String	Name of the client side widget
<code>header</code>	null	String	Text of the header
<code>draggable</code>	true	Boolean	Specifies draggability
<code>resizable</code>	true	Boolean	Specifies resizability
<code>modal</code>	false	Boolean	Enables modality.
<code>visible</code>	false	Boolean	When enabled, dialog is visible by default.
<code>width</code>	auto	Integer	Width of the dialog
<code>height</code>	auto	Integer	Height of the dialog
<code>minWidth</code>	150	Integer	Minimum width of a resizable dialog.

minHeight	0	Integer	Minimum height of a resizable dialog.
style	null	String	Inline style of the dialog.
styleClass	null	String	Style class of the dialog
showEffect	null	String	Effect to use when showing the dialog
hideEffect	null	String	Effect to use when hiding the dialog
position	null	String	Defines where the dialog should be displayed
closable	true	Boolean	Defines if close icon should be displayed or not
onShow	null	String	Client side callback to execute when dialog is displayed.
onHide	null	String	Client side callback to execute when dialog is hidden.
appendTo	null	String	Appends the dialog to the element defined by the given search expression.
showHeader	true	Boolean	Defines visibility of the header content.
footer	null	String	Text of the footer.
dynamic	false	Boolean	Enables lazy loading of the content with ajax.
minimizable	false	Boolean	Whether a dialog is minimizable or not.
maximizable	false	Boolean	Whether a dialog is maximizable or not.
closeOnEscape	false	Boolean	Defines if dialog should close on escape key.
dir	ltr	String	Defines text direction, valid values are <i>ltr</i> and <i>rtl</i> .
focus	null	String	Defines which component to apply focus.
fitViewport	false	Boolean	Dialog size might exceed viewport if content is bigger than viewport in terms of height. fitViewport option automatically adjusts height to fit dialog within the viewport.
positionType	fixed	String	Defines whether dialog will be kept in viewport on scroll (fixed) or keep its position (absolute).
responsive	false	Boolean	In responsive mode, dialog adjusts itself based on screen width.

Getting started with the Dialog

Dialog is a panel component containing other components, note that by default dialog is not visible.

Show and Hide

Showing and hiding the dialog is easy using the client side api.

Effects

There are various effect options to be used when displaying and closing the dialog. Use `showEffect` and `hideEffect` options to apply these effects; blind, bounce, clip, drop, explode, fade, fold, highlight, puff, pulsate, scale, shake, size, slide and transfer.

Position

By default dialog is positioned at center of the viewport and `position` option is used to change the location of the dialog. Possible values are;

- Single string value like '`center`', '`left`', '`right`', '`top`', '`bottom`' representing the position within viewport.
- Comma separated x and y coordinate values like `200, 500`
- Comma separated position values like '`top`', '`right`'. (Use single quotes when using a combination)

Some examples are described below;

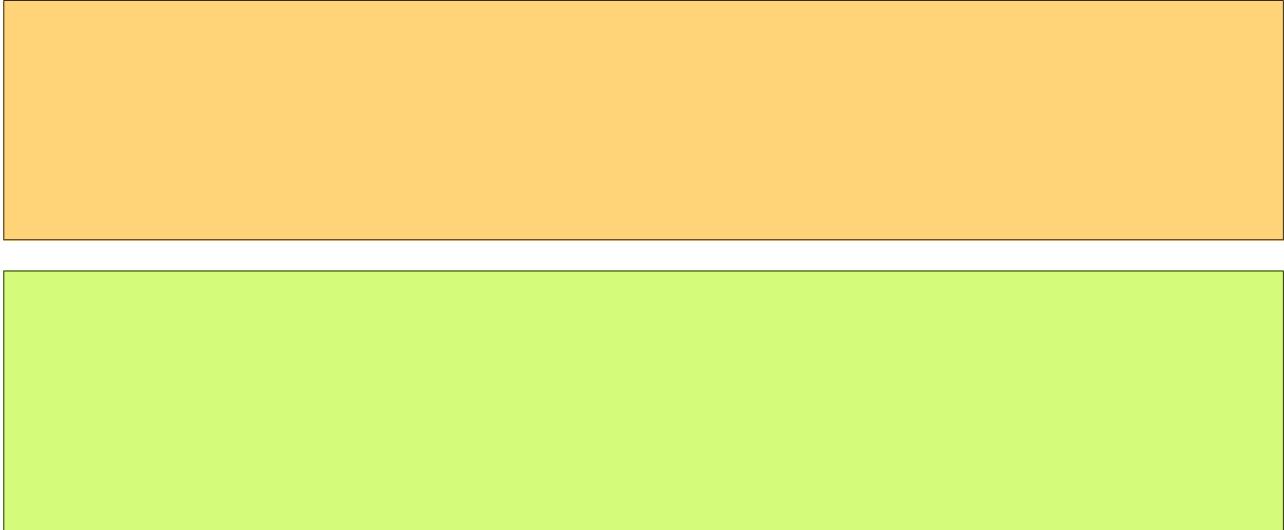

Focus

Dialog applies focus on first visible input on show by default which is useful for user friendliness however in some cases this is not desirable. Assume the first input is a popup calendar and opening the dialog shows a popup calendar. To customize default focus behavior, use `focus` attribute.

Ajax Behavior Events

event is one of the ajax behavior events provided by dialog that is fired when the dialog is hidden. If there is a listener defined it'll be executed by passing an instance of `org.primefaces.event.CloseEvent`.

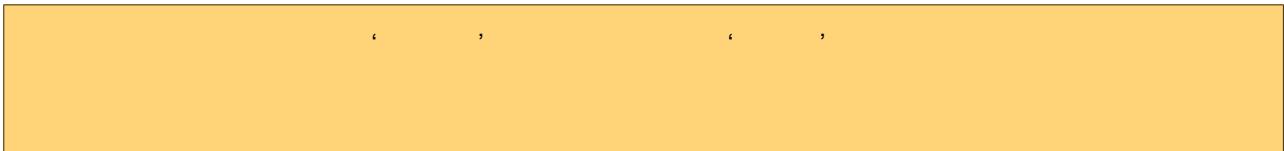

Example below adds a FacesMessage when dialog is closed and updates the messages component to display the added message.

Other provided ajax behavior events are
and .

Client Side Callbacks

Similar to close listener, onShow and onHide are handy callbacks for client side in case you need to execute custom javascript.

Client Side API

Widget: `PrimeFaces.widget.Dialog`

<code>show()</code>	-	<code>void</code>	Displays dialog.
<code>hide()</code>	-	<code>void</code>	Closes dialog.
<code>isVisible()</code>	-	<code>void</code>	Returns visibility as a boolean.

Skinning

Dialog resides in a main container element which `styleClass` option apply. Following is the list of structural style classes;

.ui-dialog	Container element of dialog
.ui-dialog-titlebar	Title bar
.ui-dialog-title-dialog	Header text
.ui-dialog-titlebar-close	Close icon
.ui-dialog-content	Dialog body

As skinning style classes are global, see the main theming section for more information.

Tips

- Use appendTo with care as the page definition and html dom would be different, for example if dialog is inside an h:form component and appendToBody is enabled, on the browser dialog would be outside of form and may cause unexpected results. In this case, nest a form inside a dialog.
- Do not place dialog inside tables, containers like divs with relative positioning or with non-visible overflow defined, in cases like these functionality might be broken. This is not a limitation but a result of DOM model. For example dialog inside a layout unit, tabview, accordion are a couple of examples. Same applies to confirmDialog as well.
- A facet called “header” is available to provide custom content inside header instead of using header attribute.

3.40 Drag&Drop

Drag&Drop utilities of PrimeFaces consists of two components; Draggable and Droppable.

3.40.1 Draggable

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget
proxy	false	Boolean	Displays a proxy element instead of actual element.
dragOnly	false	Boolean	Specifies a draggable that can't be dropped.
for	null	String	Id of the component to add draggable behavior
disabled	false	Boolean	Disables draggable behavior when true.
axis	null	String	Specifies drag axis, valid values are 'x' and 'y'.
containment	null	String	Constraints dragging within the boundaries of containment element
helper	null	String	Helper element to display when dragging
revert	false	Boolean	Reverts draggable to it's original position when not dropped onto a valid droppable
snap	false	Boolean	Draggable will snap to edge of near elements
snapMode	null	String	Specifies the snap mode. Valid values are 'both', 'inner' and 'outer'.

snapTolerance	20	Integer	Distance from the snap element in pixels to trigger snap.
zindex	null	Integer	ZIndex to apply during dragging.
handle	null	String	Specifies a handle for dragging.
opacity	1	Double	Defines the opacity of the helper during dragging.
stack	null	String	In stack mode, draggable overlap is controlled automatically using the provided selector, dragged item always overlays other draggables.
grid	null	String	Dragging happens in every x and y pixels.
scope	null	String	Scope key to match draggables and droppables.
cursor	crosshair	String	CSS cursor to display in dragging.
dashboard	null	String	Id of the dashboard to connect with.
appendTo	null	String	A search expression to define which element to append the draggable helper to.

Getting started with Draggable

Any component can be enhanced with draggable behavior, basically this is achieved by defining the id of component using the *for* attribute of draggable.

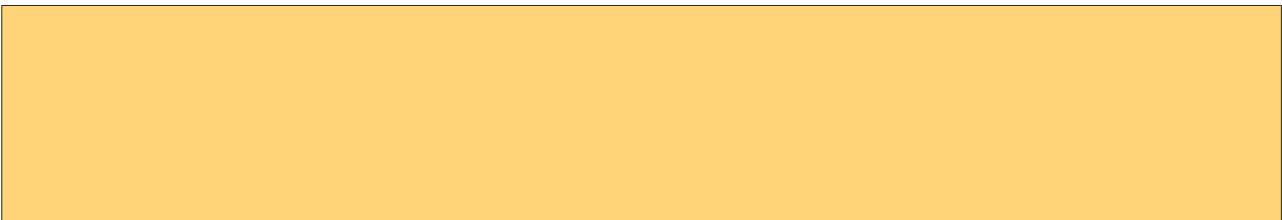

If you omit the for attribute, parent component will be selected as the draggable target.

Handle

By default any point in dragged component can be used as handle, if you need a specific handle, you can define it with handle option. Following panel is dragged using it's header only.

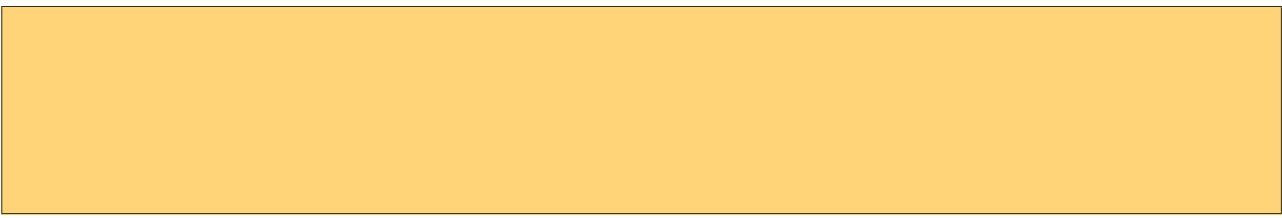

Drag Axis

Dragging can be limited to either horizontally or vertically.

Clone

By default, actual component is used as the drag indicator, if you need to keep the component at it's original location, use a clone helper.

Revert

When a draggable is not dropped onto a matching droppable, revert option enables the component to move back to it's original position with an animation.

Opacity

During dragging, opacity option can be used to give visual feedback, helper of following panel's opacity is reduced in dragging.

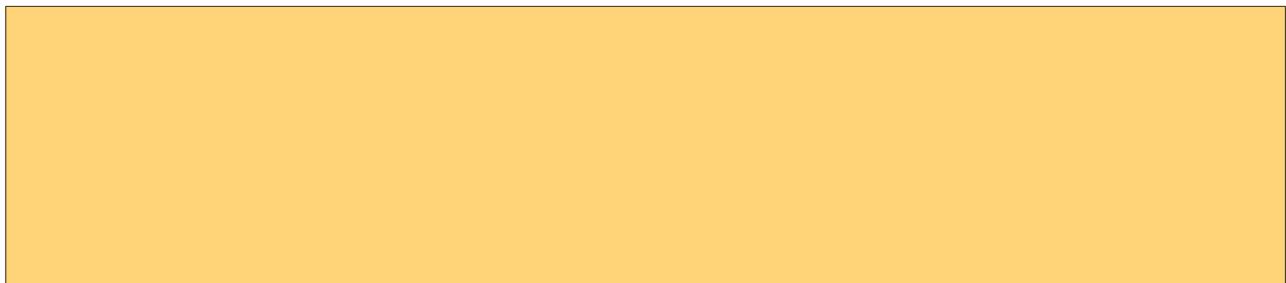

Grid

Defining a grid enables dragging in specific pixels. This value takes a comma separated dimensions in x,y format.

Containment

A draggable can be restricted to a certain section on page, following draggables cannot go outside of it's parent.

3.40.2 Droppable

Info

Tag	
Component Class	
Component Type

Renderer Type	
Renderer Class	

Attributes

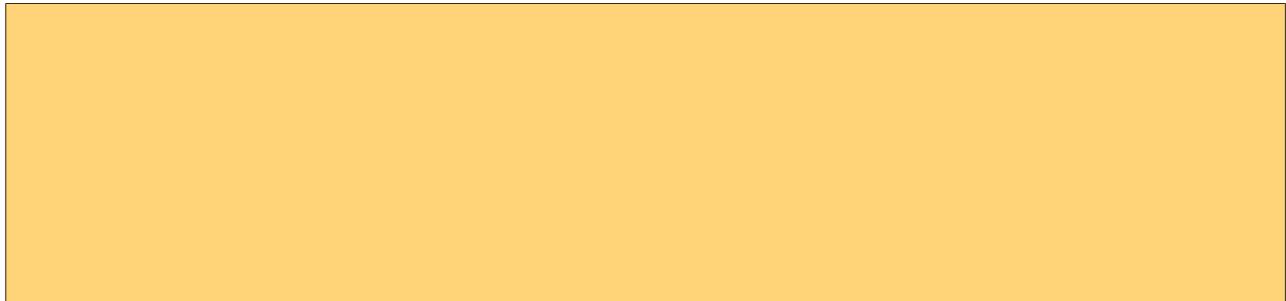

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Variable name of the client side widget
for	null	String	Id of the component to add droppable behavior
disabled	false	Boolean	Disables or enables droppable behavior
hoverStyleClass	null	String	Style class to apply when an acceptable draggable is dragged over.
activeStyleClass	null	String	Style class to apply when an acceptable draggable is being dragged.
onDrop	null	String	Client side callback to execute when a draggable is dropped.
accept	null	String	Selector to define the accepted draggables.
scope			
tolerance			
datasource			

Getting Started with Droppable

Usage of droppable is very similar to draggable, droppable behavior can be added to any component specified with the `for` attribute.

slot `styleClass` represents a small rectangle.

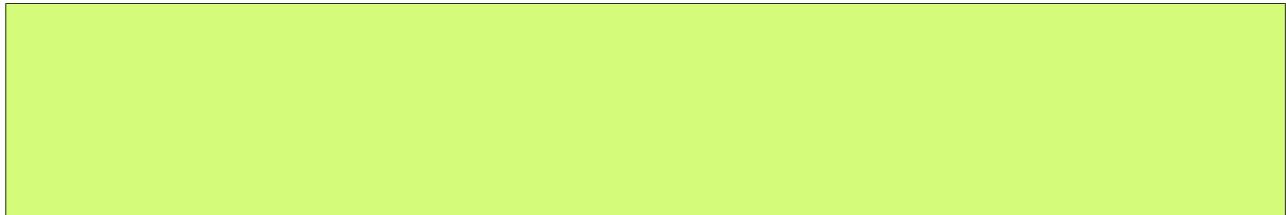

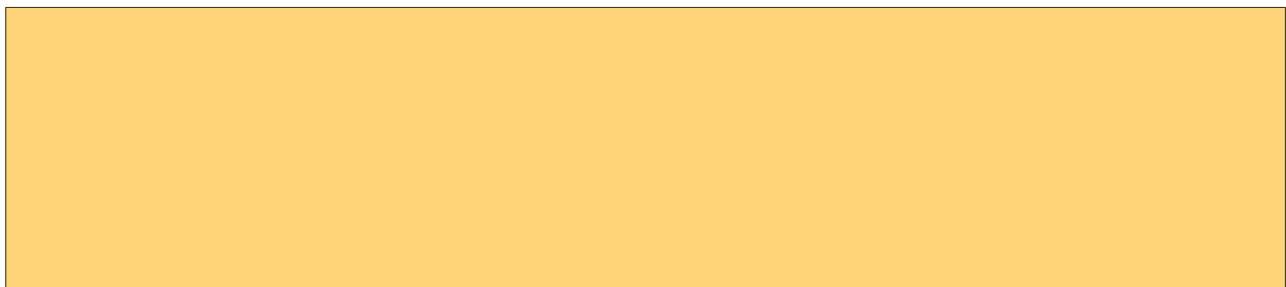

If `for` attribute is omitted, parent component becomes droppable.

Ajax Behavior Events

`drop` is the only and default ajax behavior event provided by droppable that is processed when a valid draggable is dropped. In case you define a listener it'll be executed by passing an `org.primefaces.event.DragDrop` event instance parameter holding information about the dragged and dropped components.

Following example shows how to enable draggable images to be dropped on droppables.

onDrop

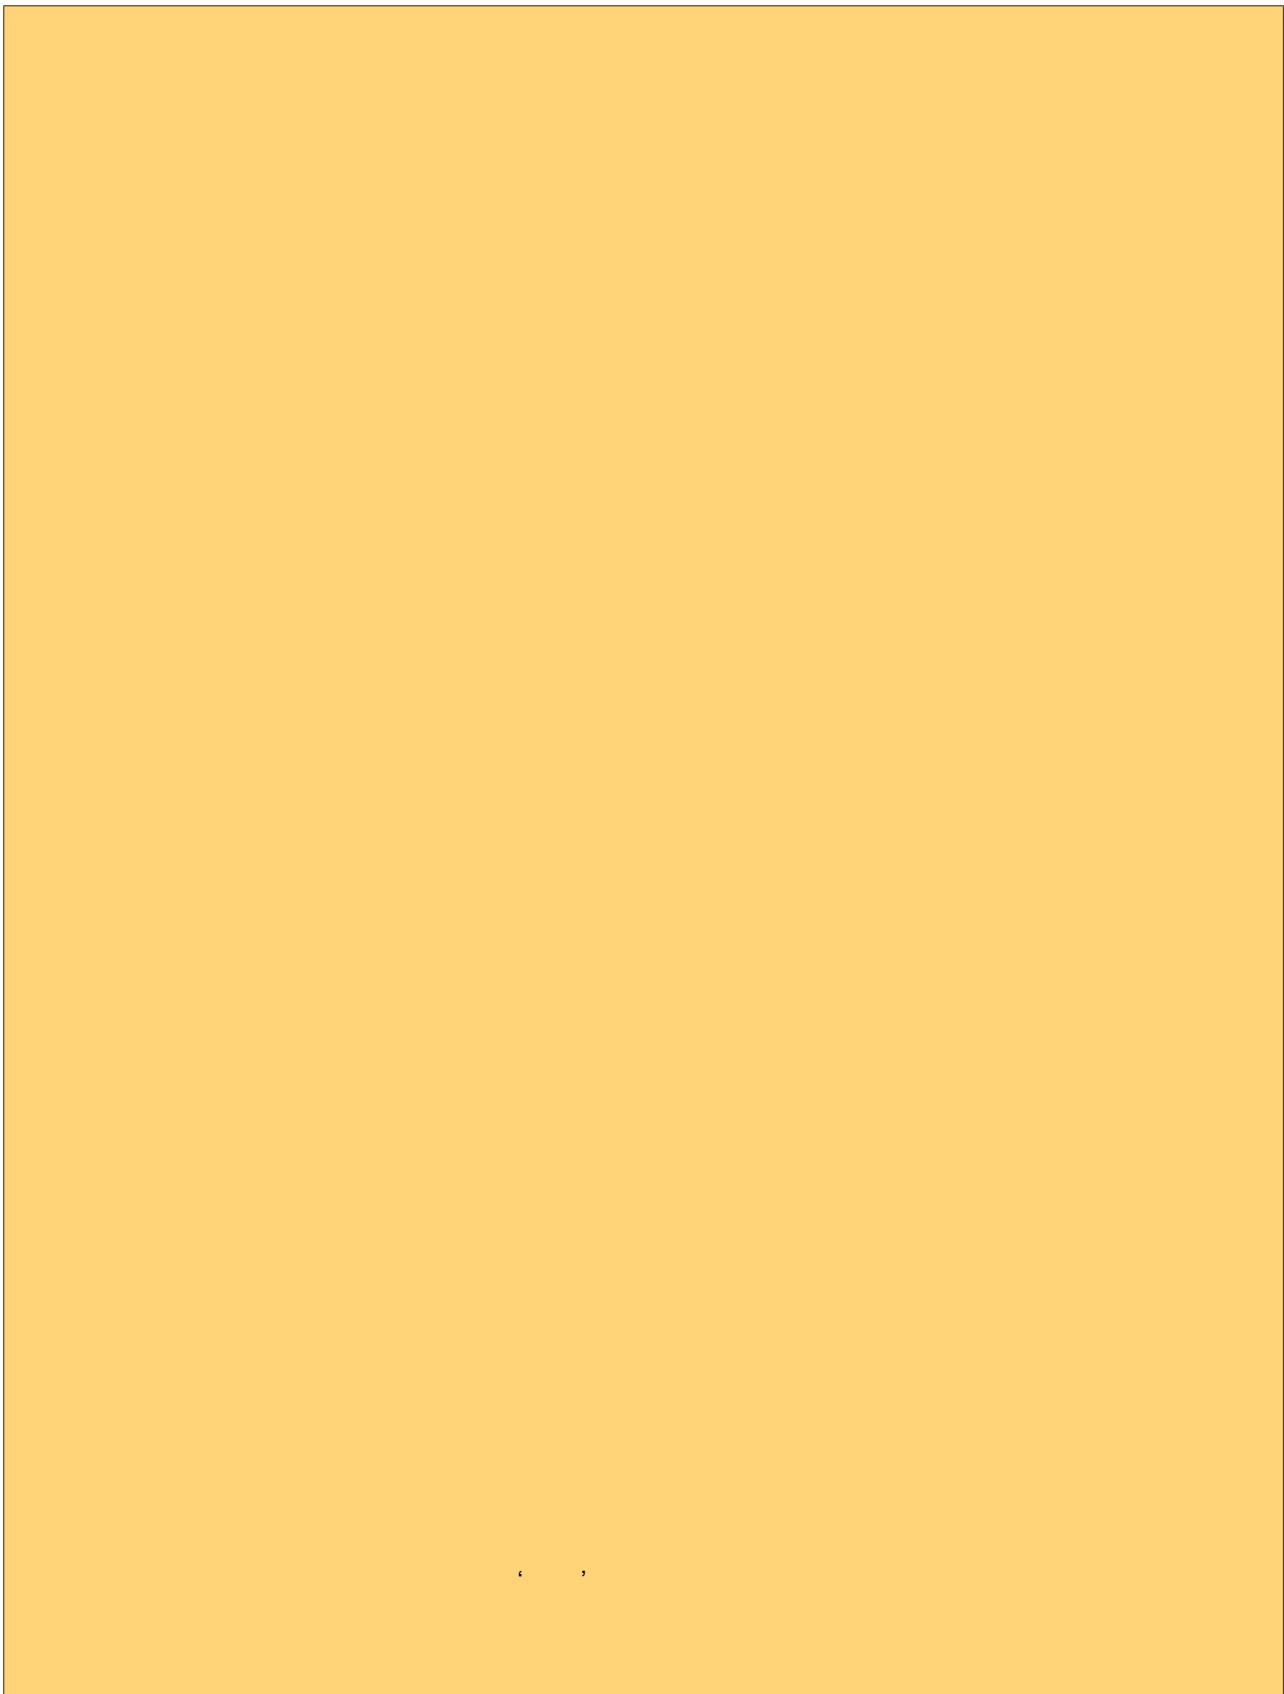

onDrop is a client side callback that is invoked when a draggable is dropped, it gets two parameters event and ui object holding information about the drag drop event.

DataSource

Droppable has special care for data elements that extend from UIData(e.g. datatable, datagrid), in order to connect a droppable to accept data from a data component define datasource option as the id of the data component. Example below show how to drag data from datagrid and drop onto a droppable to implement a dragdrop based selection. Dropped cars are displayed with a datatable.

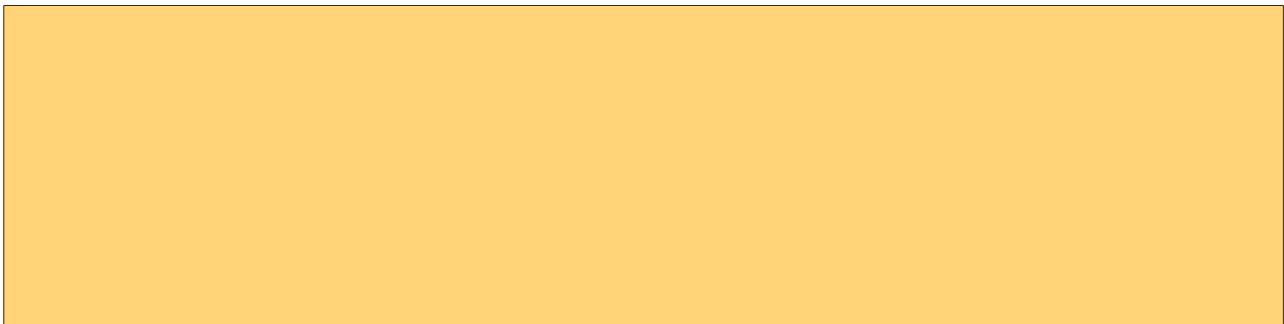

Tolerance

There are four different tolerance modes that define the way of accepting a draggable.

fit	draggable should overlap the droppable entirely
intersect	draggable should overlap the droppable at least 50%
pointer	pointer of mouse should overlap the droppable
touch	droppable should overlap the droppable at any amount

Acceptance

You can limit which draggables can be dropped onto droppables using scope attribute which a draggable also has. Following example has two images, only first image can be accepted by droppable.

Skinning

hoverStyleClass and *activeStyleClass* attributes are used to change the style of the droppable when interacting with a draggable.

3.41 Dock

Dock component mimics the well known dock interface of Mac OS X.

Info

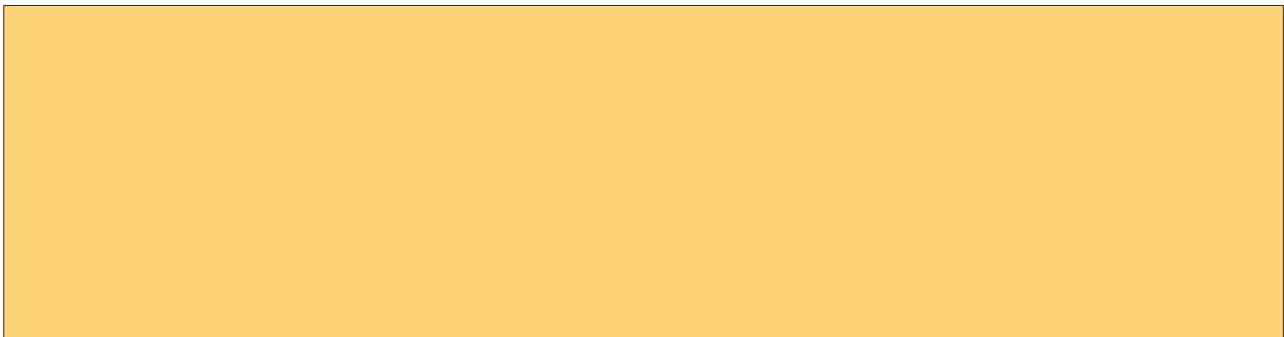

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
model	null	MenuModel	MenuModel instance to create menus programmatically
position	bottom	String	Position of the dock, <i>bottom</i> or <i>top</i> .
itemWidth	40	Integer	Initial width of items.
maxWidth	50	Integer	Maximum width of items.
proximity	90	Integer	Distance to enlarge.
halign	center	String	Horizontal alignment,
widgetVar	null	String	Name of the client side widget.

Getting started with the Dock

A dock is composed of menuitems.

Position

Dock can be located in two locations, *top* or *bottom* (default). For a dock positioned at top set position to top.

Dock Effect

When mouse is over the dock items, icons are zoomed in. The configuration of this effect is done via the maxWidth and proximity attributes.

Dynamic Menus

Menus can be created programmatically as well, see the dynamic menus part in menu component section for more information and an example.

Skinning

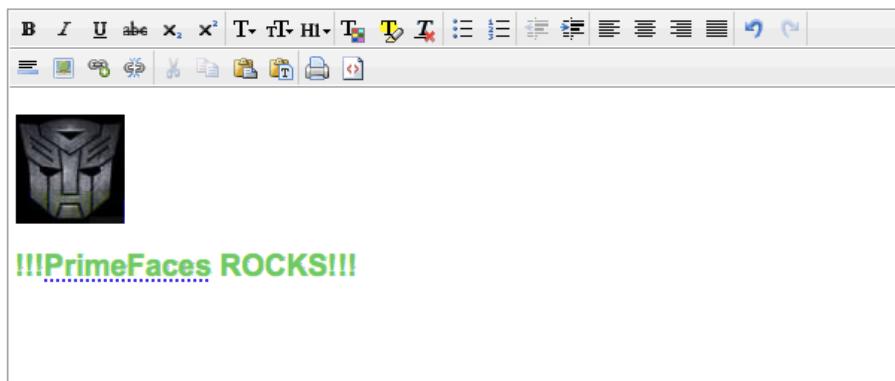

Following is the list of structural style classes, {positon} can be *top* or *bottom*.

.ui-dock-{position}	Main container.
.ui-dock-container-{position}	Menu item container.
.ui-dock-item-{position}	Each menu item.

As skinning style classes are global, see the main theming section for more information.

3.42 Editor

Editor is an input component with rich text editing capabilities. (Deprecated: Use TextEditor instead)

Info

Tag	
Component Class	
Component Type	
Component Family

Renderer Class	

Attributes

<code>id</code>	null	String	Unique identifier of the component.
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
<code>value</code>	null	Object	Value of the component than can be either an EL expression or a literal text.
<code>converter</code>	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id.
<code>immediate</code>	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.

required	false	Boolean	Marks component as required.
validator	null	Method Expr	A method expression that refers to a method validating the input.
valueChangeListener	null	Method Expr	A method expression that refers to a method for handling a valuechangeevent.
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fails.
widgetVar	null	String	Name of the client side widget.
controls	null	String	List of controls to customize toolbar.
height	null	Integer	Height of the editor.
width	null	Integer	Width of the editor.
disabled	false	Boolean	Disables editor.
style	null	String	Inline style of the editor container.
styleClass	null	String	Style class of the editor container.
onchange	null	String	Client side callback to execute when editor data changes.
maxlength	null	Integer	Maximum length of the raw input.

Getting started with the Editor

Rich Text entered using the Editor is passed to the server using *value* expression.

Custom Toolbar

Toolbar of editor is easy to customize using *controls* option;

Here is the full list of all available controls;

<ul style="list-style-type: none"> • bold • italic • underline • strikethrough • subscript • superscript • font • size • style • color • highlight • bullets • numbering • alignleft • center • alignright 	<ul style="list-style-type: none"> • justify • undo • redo • rule • image • link • unlink • cut • copy • paste • pastetext • print • source • outdent • indent • removeFormat
--	---

Client Side API

Widget: *PrimeFaces.widget.Editor*

init()	-	void	Initializes a lazy editor, subsequent calls do not reinits the editor.
saveHTML()	-	void	Saves html text in iframe back to the textarea.
clear()	-	void	Clears the text in editor.
enable()	-	void	Enables editing.
disable()	-	void	Disables editing.
focus()	-	void	Adds cursor focus to edit area.
selectAll()	-	void	Selects all text in editor.
getSelectedHTML()	-	String	Returns selected text as HTML.

getSelectedText()	-	String	Returns selected text in plain format.

Skinning

Following is the list of structural style classes.

.ui-editor	Main container.
.ui-editor-toolbar	Toolbar of editor.
.ui-editor-group	Button groups.
.ui-editor-button	Each button.
.ui-editor-divider	Divider to separate buttons.
.ui-editor-disabled	Disabled editor controls.
.ui-editor-list	Dropdown lists.
.ui-editor-color	Color picker.
.ui-editor-popup	Popup overlays.
.ui-editor-prompt	Overlays to provide input.
.ui-editor-message	Overlays displaying a message.

Editor is not integrated with ThemeRoller as there is only one icon set for the controls.

3.43 Effect

Effect component is based on the jQuery UI effects library.

Info

Tag	
Tag Class	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id		
rendered	1	Boolean
binding	null	Object
widgetVar	null	String
event	null	String
type	null	String
delay	null	Integer
queue	true	Boolean

Effect component needs a trigger

Effect component needs a trigger and target which is effect's parent by default. In example below clicking outputText (trigger) will run the pulsate effect on outputText(target) itself.

Effect Target

There may be cases where you want to display an effect on another target on the same page while keeping the parent as the trigger. Use *for* option to specify a target.

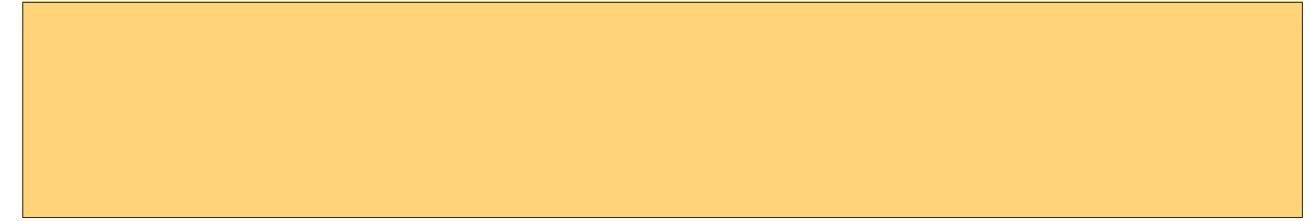

With this setting, `outputLink` becomes the trigger for the effect on `graphicImage`. When the link is clicked, initially hidden `graphicImage` comes up with a fade effect.

: It's important for components that have the effect component as a child to have an assigned id because some components do not render their clientId's if you don't give them an id explicitly.

List of Effects

Effect Configuration

Each effect has different parameters for animation like colors, duration and more. In order to change the configuration of the animation, provide these parameters with the f:param tag.

It's important to provide string options with single quotes.

For the full list of configuration parameters for each effect, please see the jquery documentation;

Effect on Load

Effects can also be applied to any JSF component when page is loaded for the first time or after an ajax request is completed by using *load* as the event name. Following example animates messages with pulsate effect after ajax request completes.

3.44 FeedReader

FeedReader is used to display content from a feed.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	String	URL of the feed.
var	null	String	Iterator to refer each item in feed.
size	Unlimited	Integer	Number of items to display.

Getting started with FeedReader

FeedReader requires a feed url to display and renders its content for each feed item.

Note that you need the ROME library in your classpath to make feedreader work.

3.45 Fieldset

Fieldset is a grouping component as an extension to html fieldset.

Info

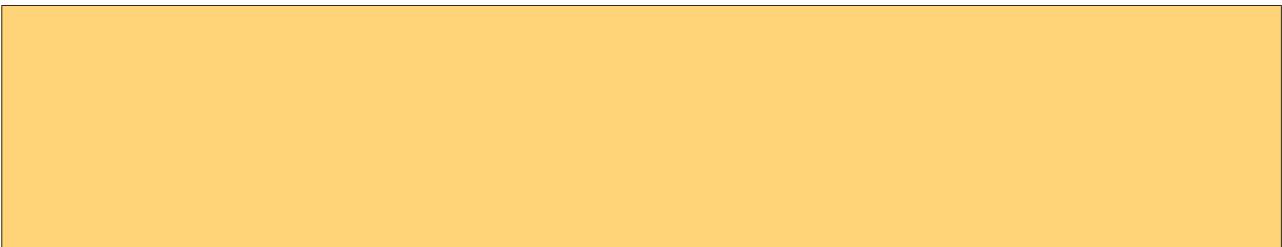

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
legend	null	String	Title text.
style	null	String	Inline style of the fieldset.
styleClass	null	String	Style class of the fieldset.
toggleable	false	Boolean	Makes content toggleable with animation.
toggleSpeed	500	Integer	Toggle duration in milliseconds.
collapsed	false	Boolean	Defines initial visibility state of content.

Getting started with Fieldset

Fieldset is used as a container component for its children.

Legend

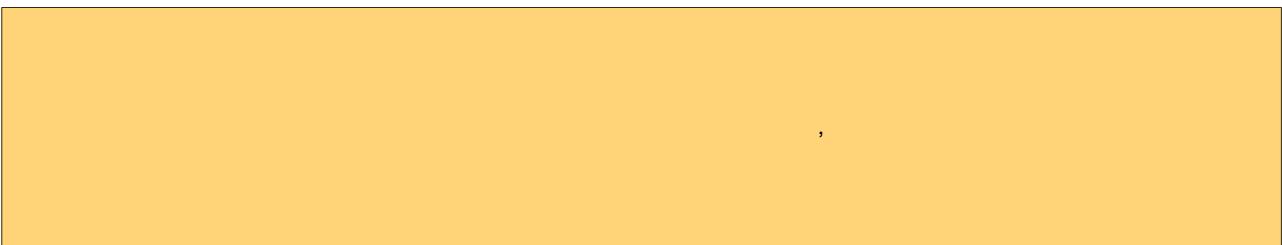

Legend can be defined in two ways, with legend attribute as in example above or using legend facet. Use facet way if you need to place custom html other than simple text.

When both legend attribute and legend facet are present, facet is chosen.

Toggleable Content

Clicking on fieldset legend can toggle contents, this is handy to use space efficiently in a layout. Set toggleable to true to enable this feature.

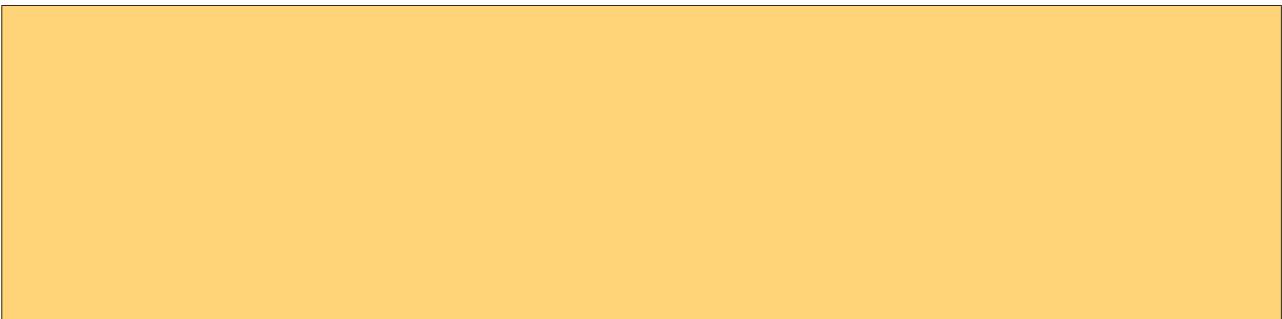

— Toggleable Fieldset

Francis Ford Coppola's legendary continuation and sequel to his landmark 1972 film, *The Godfather*, parallels the young Vito Corleone's rise with his son Michael's spiritual fall, deepening *The Godfather's* depiction of the dark side of the American dream. In the early 1900s, the child Vito flees his Sicilian village for America after the local Mafia kills his family. Vito struggles to make a living, legally or illegally, for his wife and growing brood in Little Italy, killing the local Black Hand Fanucci after he demands his customary cut of the tyro's business. With Fanucci gone, Vito's communal stature grows.

Ajax Behavior Events

toggle is the default and only ajax behavior event provided by fieldset that is processed when the content is toggled. In case you have a listener defined, it will be invoked by passing an instance of *org.primefaces.event.ToggleEvent*.

Here is an example that adds a facesmessage and updates growl component when fieldset is toggled.

Client Side API

Widget: *PrimeFaces.widget.Fieldset*

toggle()	-	void	Toggles fieldset content.

Skinning

style and *styleClass* options apply to the fieldset. Following is the list of structural style classes;

.ui-fieldset	Main container
.ui-fieldset-toggleable	Main container when fieldset is toggleable
.ui-fieldset .ui-fieldset-legend	Legend of fieldset
.ui-fieldset-toggleable .ui-fieldset-legend	Legend of fieldset when fieldset is toggleable
.ui-fieldset .ui-fieldset-toggler	Toggle icon on fieldset

As skinning style classes are global, see the main theming section for more information.

Tips

- A collapsed fieldset will remain collapsed after a postback since fieldset keeps its toggle state internally, you don't need to manage this using toggleListener and collapsed option.

3.46 FileDownload

Similarly a more graphical presentation would be to use a commandlink with an image.

If you'd like to use PrimeFaces commandButton and commandLink, disable ajax option as fileDownload requires a full page refresh to present the file.

ContentDisposition

By default, content is displayed as an *attachment* with a download dialog box, another alternative is the *inline* mode, in this case browser will try to open the file internally without a prompt. Note that content disposition is not part of the http standard although it is widely implemented.

Monitor Status

As fileDownload process is non-ajax, ajaxStatus cannot apply. Still PrimeFaces provides a feature to monitor file downloads via client side `monitorDownload(startFunction, endFunction)` method. Example below displays a modal dialog when dowload begins and hides it on complete.

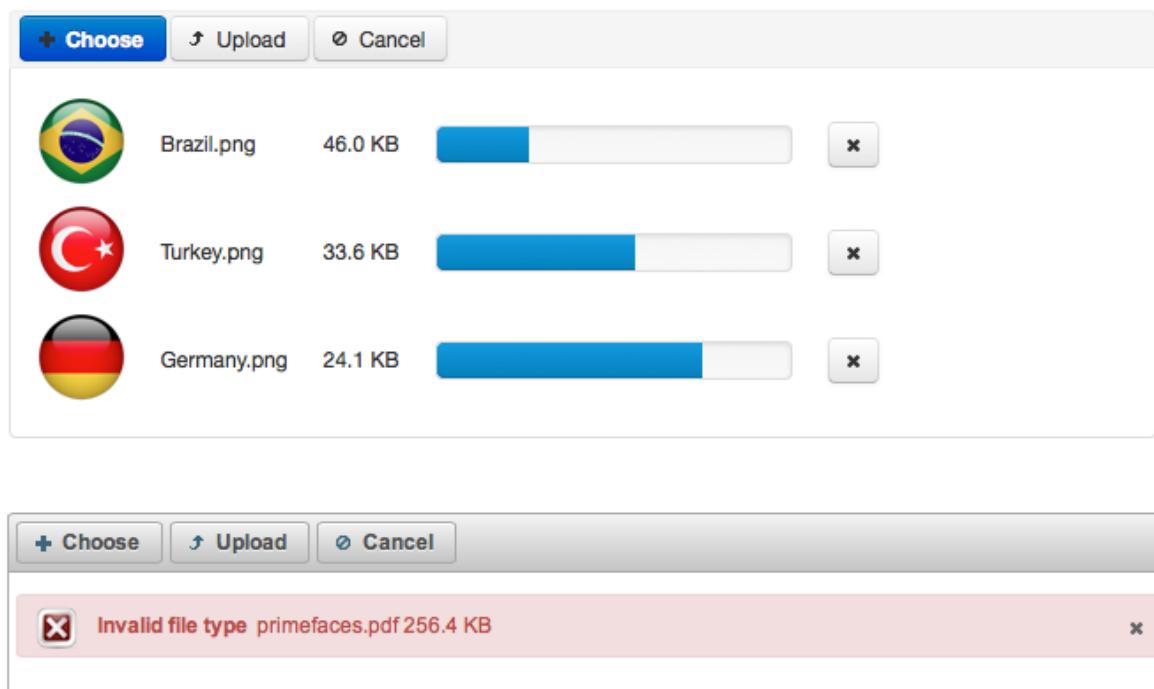

Cookies must be enabled for monitoring.

3.47 FileUpload

FileUpload goes beyond the browser input type="file" functionality and features an HTML5 powered rich solution with graceful degradation for legacy browsers.

Info

Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.

value	null	Object	Value of the component than can be either an EL expression of a literal text.
converter	null	Converter /String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id.
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required.
validator	null	MethodExpr	A method expression that refers to a method validationg the input.
valueChangeListener	null	MethodExpr	A method expression that refers to a method for handling a valuchangeevent.
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fails.
widgetVar	null	String	Name of the client side widget.
update	null	String	Component(s) to update after fileupload completes.
process	null	String	Component(s) to process in fileupload request.
fileUploadListener	null	MethodExpr	Method to invoke when a file is uploaded.
multiple	false	Boolean	Allows choosing of multi file uploads from native file browse dialog
auto	false	Boolean	When set to true, selecting a file starts the upload process implicitly.
label	Choose	String	Label of the browse button.
allowTypes	null	String	Regular expression for accepted file types, e.g. <code>/(\. \/)(gif jpe?g png)\$/</code>
sizeLimit	null	Integer	Individual file size limit in bytes.
fileLimit	null	Integer	Maximum number of files allowed to upload.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
mode	advanced	String	Mode of the fileupload, can be <i>simple</i> or <i>advanced</i> .
uploadLabel	Upload	String	Label of the upload button.
cancelLabel	Cancel	String	Label of the cancel button.

invalidSizeMessage	null	String	Message to display when size limit exceeds.
invalidFileMessage	null	String	Message to display when file is not accepted.
fileLimitMessage	null	String	Message to display when file limit exceeds.
dragDropSupport	true	Boolean	Specifies dragdrop based file selection from filesystem, default is true and works only on supported browsers.
onstart	null	String	Client side callback to execute when upload begins.
onerror	null	String	Callback to execute if fileupload request fails.
oncomplete	null	String	Client side callback to execute when upload ends.
disabled	false	Boolean	Disables component when set true.
messageTemplate	{name} {size}	String	Message template to use when displaying file validation errors.
previewWidth	80	Integer	Width for image previews in pixels.
skinSimple	false	Boolean	Applies theming to simple uploader.
accept	null	String	Filters files in native file browser dialog.
sequential	false	Boolean	Uploads are concurrent by default, set this option to true for sequential uploads.

Getting started with FileUpload

FileUpload engine on the server side can either be servlet 3.0 or commons fileupload. PrimeFaces selects the most appropriate uploader engine by detection and it is possible to force one or the other using an configuration param.

: This is the default mode and PrimeFaces tries to detect the best method by checking the runtime environment, if JSF runtime is at least 2.2 native uploader is selected, otherwise commons.

Native mode uses servlet 3.x Part API to upload the files and if JSF runtime is less than 2.2 and exception is being thrown.

: This option chooses commons fileupload regardless of the environment, advantage of this option is that it works even on a Servlet 2.5 environment.

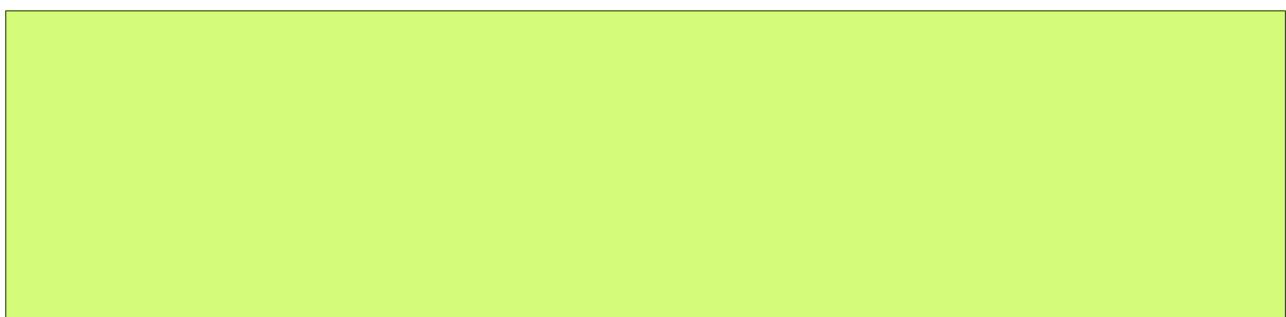

If you have decided to choose commons fileupload, it requires the following filter configuration in your web deployment descriptor.

Note that the servlet-name should match the configured name of the JSF servlet which is Faces Servlet in this case. Alternatively you can do a configuration based on url-pattern as well.

Simple File Upload

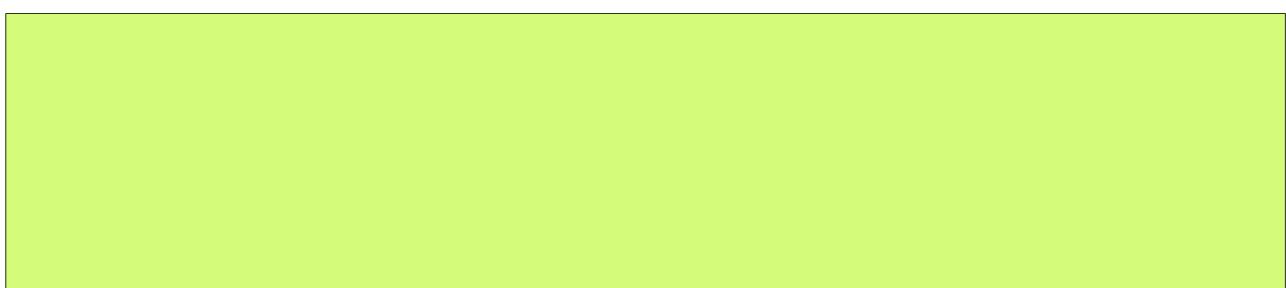

Simple file upload mode works in legacy mode with a file input whose value should be an UploadedFile instance. Ajax uploads are not supported in simple upload.

Enable skinSimple option to style the simple uploader to have a themed look that works the same across different environments.

Advanced File Upload

FileUploadListener is the way to access the uploaded files in this mode, when a file is uploaded defined fileUploadListener is processed with a FileUploadEvent as the parameter.

Multiple Uploads

Multiple uploads can be enabled using the multiple attribute so that multiple files can be selected from browser dialog. Multiple uploads are not supported in legacy browsers. Note that multiple mode is for selection only, it does not send all files in one request. FileUpload component always uses a new request for each file.

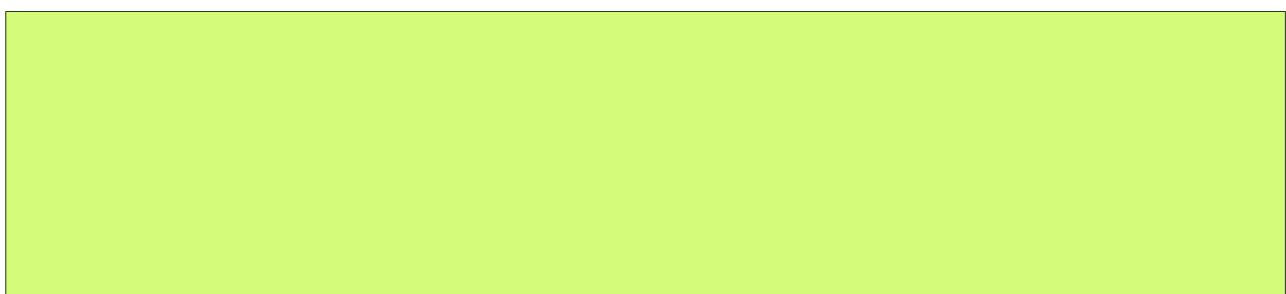

Auto Upload

Default behavior requires users to trigger the upload process, you can change this way by setting auto to true. Auto uploads are triggered as soon as files are selected from the dialog.

Partial Page Update

After the fileUpload process completes you can use the PrimeFaces PPR to update any component on the page. FileUpload is equipped with the update attribute for this purpose. Following example displays a "File Uploaded" message using the growl component after file upload.

File Filters

Users can be restricted to only select the file types you've configured, example below demonstrates how to accept images only.

Size Limit

Most of the time you might need to restrict the file upload size for a file, this is as simple as setting the sizeLimit configuration. Following fileUpload limits the size to 1000 bytes for each file.

File Limit

FileLimit restricts the number of maximum files that can be uploaded.

Validation Messages

invalidFileMessage, *invalidSizeMessage* and *fileLimitMessage* options are provided to display validation messages to the users. Similar to the FacesMessage message API, these message define the summary part, the detail part is retrieved from the *messageTemplate* option where default value is “{name} {size}”.

Skinning

FileUpload resides in a container element which *style* and *styleClass* options apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes

.ui-fileupload	Main container element
.ui-fileupload-buttonbar	Button bar
.ui-fileupload-choose	Browse button
.ui-fileupload-upload	Upload button
.ui-fileupload-cancel	Cancel button
ui-fileupload-content	Content container

Browser Compatibility

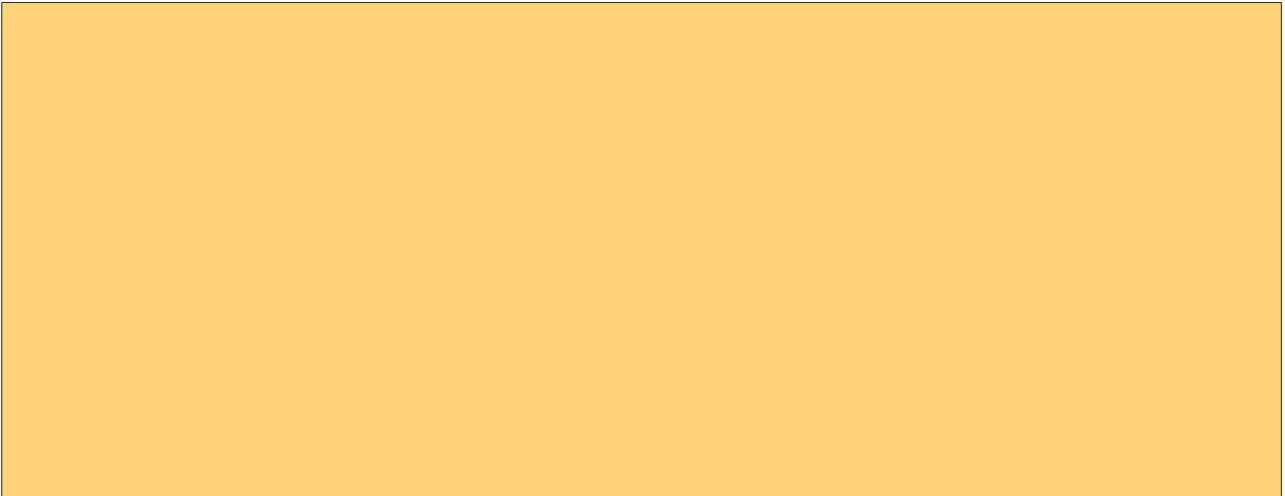

Advanced uploader is implemented with HTML5 and provides far more features compared to single version. For legacy browsers that do not support HMTL5 features like canvas or file api, fileupload uses graceful degradation so that iframe is used for transport, detailed file information is not shown and a gif animation is displayed instead of progress bar. It is suggested to offer simple uploader as a fallback.

Filter Configuration

Filter configuration is required if you are using commons uploader only. Two configuration options exist, threshold size and temporary file upload location.

thresholdSize	Maximum file size in bytes to keep uploaded files in memory. If a file exceeds this limit, it'll be temporarily written to disk.
uploadDirectory	Disk repository path to keep temporary files that exceeds the threshold size. By default it is System.getProperty("java.io.tmpdir")

An example configuration below defined thresholdSize to be 50kb and uploads to users temporary folder.

Note that uploadDirectory is used internally, you always need to implement the logic to save the file contents yourself in your backing bean.

3.48 Focus

Focus is a utility component that makes it easy to manage the element focus on a JSF page.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

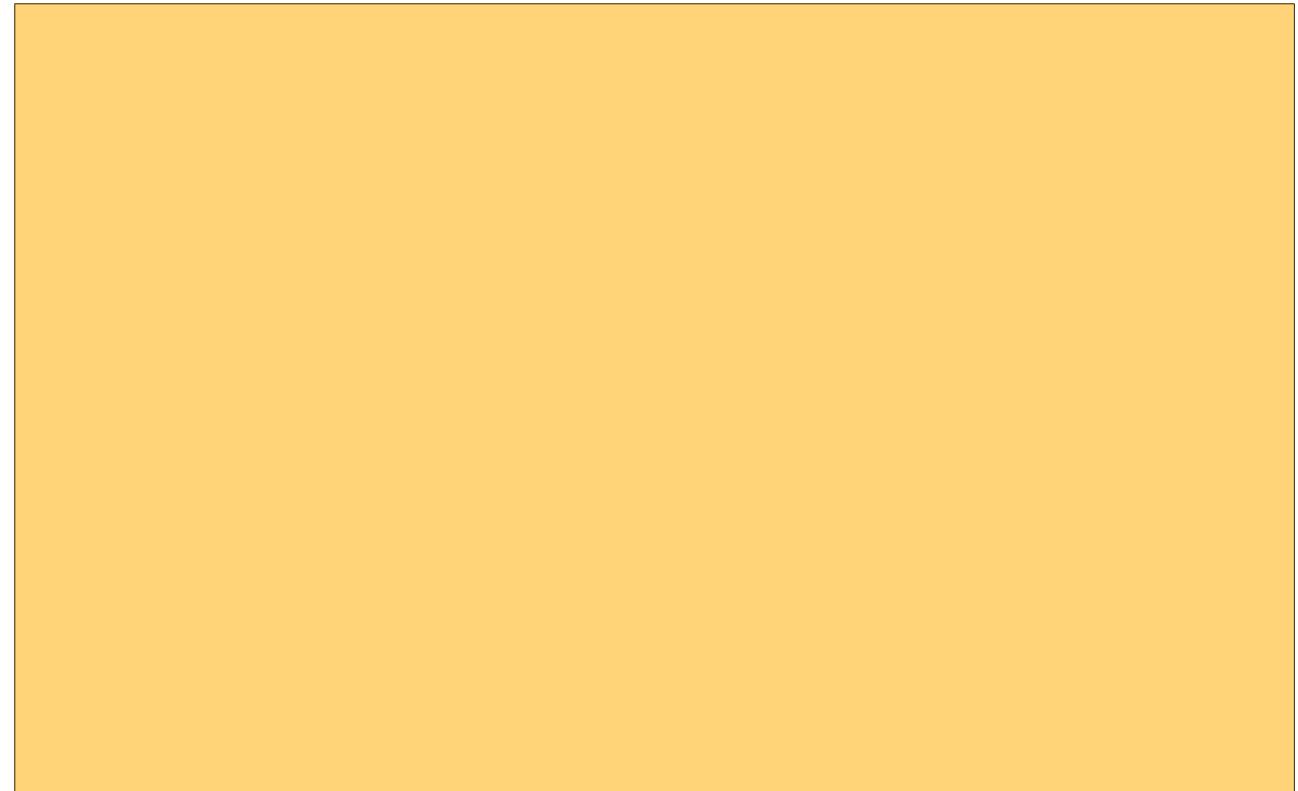

id	null	String	Unique identifier of the component
rendered	true	boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
for	null	String	Specifies the exact component to set focus
context	null	String	The root component to start first input search.
minSeverity	error	String	Minimum severity level to be used when finding the first invalid component

Getting started with Focus

By default focus will find the *first enabled and visible input component* on page and apply focus. Input component can be any element such as input, textarea and select.

Following is a simple example;

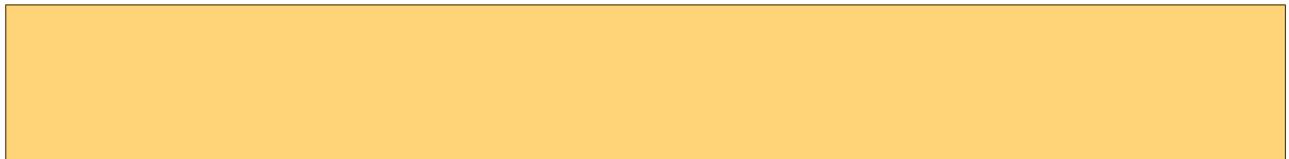

When this page initially opens up, input text with id "firstname" will receive focus as it is the first input component.

Validation Aware

Another useful feature of focus is that when validations fail, *first invalid component* will receive a focus. So in previous example if firstname field is valid but surname field has no input, a validation error will be raised for surname, in this case focus will be set on surname field implicitly. Note that for this feature to work on ajax requests, you need to update p:focus component as well.

Explicit Focus

Additionally, using for attribute focus can be set explicitly on an input component which is useful when using a dialog.

3.49 Fragment

Fragment component is used to define automatically partially process and update sections whenever ajax request is triggered by a descendant component.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

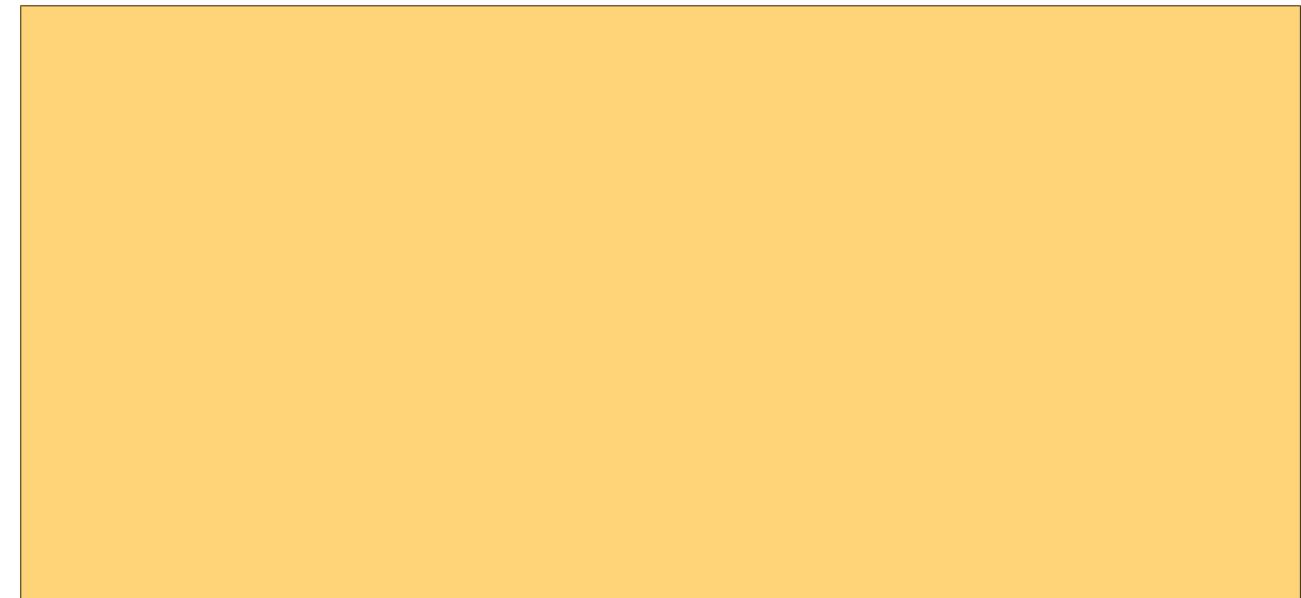

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
autoUpdate	false	Boolean	Updates the fragment automatically.

Getting started with Fragment

In the following case, required input field outside the fragment is ignored and only the contents of the fragment are processed-updated automatically on button click since button is inside the fragment. Fragment makes it easy to define partial ajax process and update without explicitly defining component identifiers.

AutoUpdate has different notion compared to autoUpdate of message, growl and outputPanel. The fragment is updated automatically after an ajax request if the source is a descendant. In other mentioned components, there is no such restriction as they are updated for every ajax request regardless of the source.

3.50 Galleria

Galleria is used to display a set of images.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

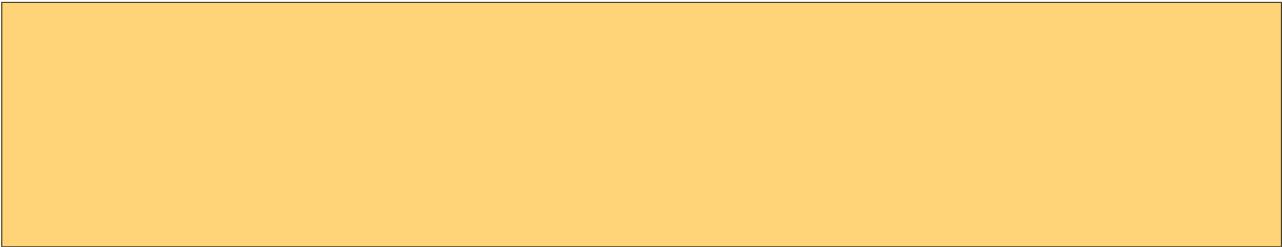

Attributes

id	null	String	Unique identifier of the component
rendered	true	boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
value	null	Collection	Collection of data to display.
var	null	String	Name of variable to access an item in collection.
style	null	String	Inline style of the container element.
styleClass	null	String	Style class of the container element.
effect	fade	String	Name of animation to use.

effectSpeed	700	Integer	Duration of animation in milliseconds.
panelWidth	600	Integer	Width of the viewport.
panelHeight	400	Integer	Height of the viewport.
frameWidth	60	Integer	Width of the frames.
frameHeight	40	Integer	Height of the frames.
showFilmstrip	true	Boolean	Defines visibility of filmstrip.
showCaption	false	Boolean	Defines visibility of captions.
transitionInterval	4000	Integer	Defines interval of slideshow.
autoPlay	true	Boolean	Images are displayed in a slideshow in autoPlay.

Getting Started with Galleria

Images to displayed are defined as children of galleria;

Galleria displays the details of an image using an overlay which is displayed by clicking the information icon. Title of this popup is retrieved from the image *title* attribute and description from *alt* attribute so it is suggested to provide these attributes as well.

Dynamic Collection

Most of the time, you would need to display a dynamic set of images rather than defining each image declaratively. For this you can use built-in data iteration feature.

Effects

There are various effect options to be used in transitions; blind, bounce, clip, drop, explode, fade, fold, highlight, puff, pulsate, scale, shake, size, slide and transfer.

By default animation takes 500 milliseconds, use *effectSpeed* option to tune this.

Skinning

Galleria resides in a main container element which *style* and *styleClass* options apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes

.ui-galleria	Container element for galleria.
.ui-galleria-panel-wrapper	Container of panels.
.ui-galleria-panel	Container of each image.
.ui-galleria-caption	Caption element.
.ui-galleria-nav-prev, .ui-galleria-nav-next	Navigators of filmstrip.
.ui-galleria-filmstrip-wrapper	Container of filmstrip.
.ui-galleria-filmstrip	Filmstrip element.
.ui-galleria-frame	Frame element in a filmstrip.
.ui-galleria-frame-content	Content of a frame.
.ui-galleria-frame-image	Thumbnail image.

3.51 GMap

GMap is a map component integrated with Google Maps API V3.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
widgetVar	null	String	Name of the client side widget.
model	null	MapModel	An org.primefaces.model.MapModel instance.

style	null	String	Inline style of the map container.
styleClass	null	String	Style class of the map container.
type	null	String	Type of the map.
center	null	String	Center point of the map.
zoom	8	Integer	Defines the initial zoom level.
streetView	false	Boolean	Controls street view support.
disableDefaultUI	false	Boolean	Disables default UI controls
navigationControl	true	Boolean	Defines visibility of navigation control.
mapTypeControl	true	Boolean	Defines visibility of map type control.
draggable	true	Boolean	Defines draggability of map.
disabledDoubleClickZoom	false	Boolean	Disables zooming on mouse double click.
onPointClick	null	String	Javascript callback to execute when a point on map is clicked.
fitBounds	true	Boolean	Defines if center and zoom should be calculated automatically to contain all markers on the map.
scrollWheel	false	Boolean	Controls scrollwheel zooming on the map.

Getting started with GMap

First thing to do is placing V3 of the Google Maps API that the GMap is based on. Ideal location is the head section of your page.

As Google Maps api states, mandatory sensor parameter is used to specify if your application requires a sensor like GPS locator. Four options are required to place a gmap on a page, these are center, zoom, type and style.

center: Center of the map in lat, lng format

zoom: Zoom level of the map

type: Type of map, valid values are, "hybrid", "satellite", "hybrid" and "terrain".

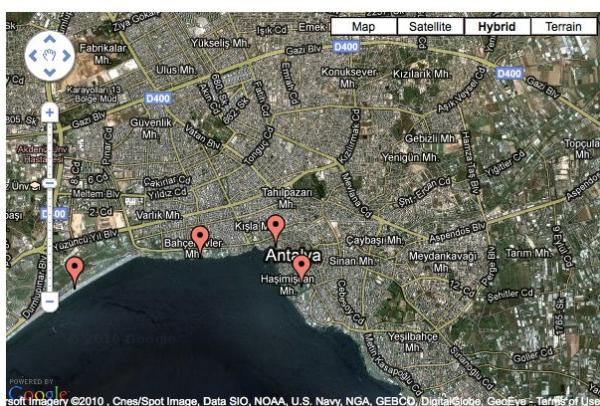

style: Dimensions of the map.

MapModel

GMap is backed by an *org.primefaces.model.map.MapModel* instance, PrimeFaces provides *org.primefaces.model.map.DefaultMapModel* as the default implementation. API Docs of all GMap related model classes are available at the end of GMap section and also at javadocs of PrimeFaces.

Markers

A marker is represented by *org.primefaces.model.map.Marker*.

Polyline

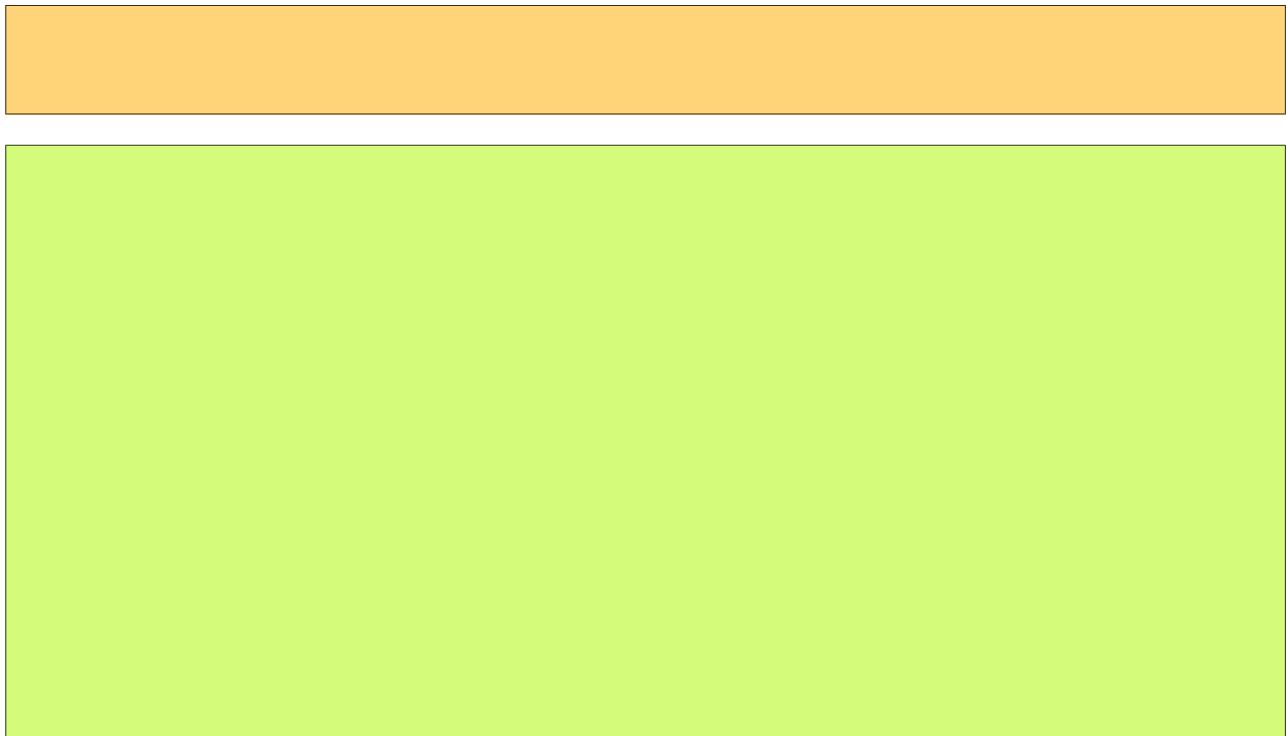

A polyline is represented by *org.primefaces.model.map.Polyline*.

Polygons

A polygon is represented by *org.primefaces.model.map.Polygon*.

Circles

A circle is represented by *org.primefaces.model.map.Circle*.

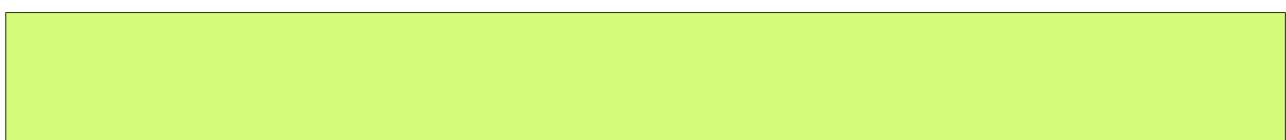

Rectangles

A circle is represented by *org.primefaces.model.map.Rectangle*.

GeoCoding

Geocoding support is provided by client side api. Results are then passed to the backing bean using *GeocodeEvent* and *ReverseGeocodeEvent* instances via ajax behavior callbacks.

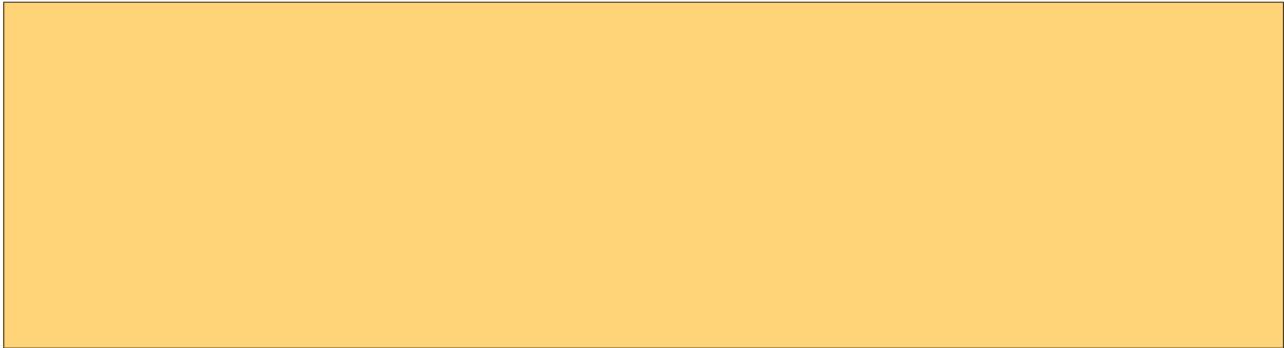

Ajax Behavior Events

GMap provides many custom ajax behavior events for you to hook-in to various features.

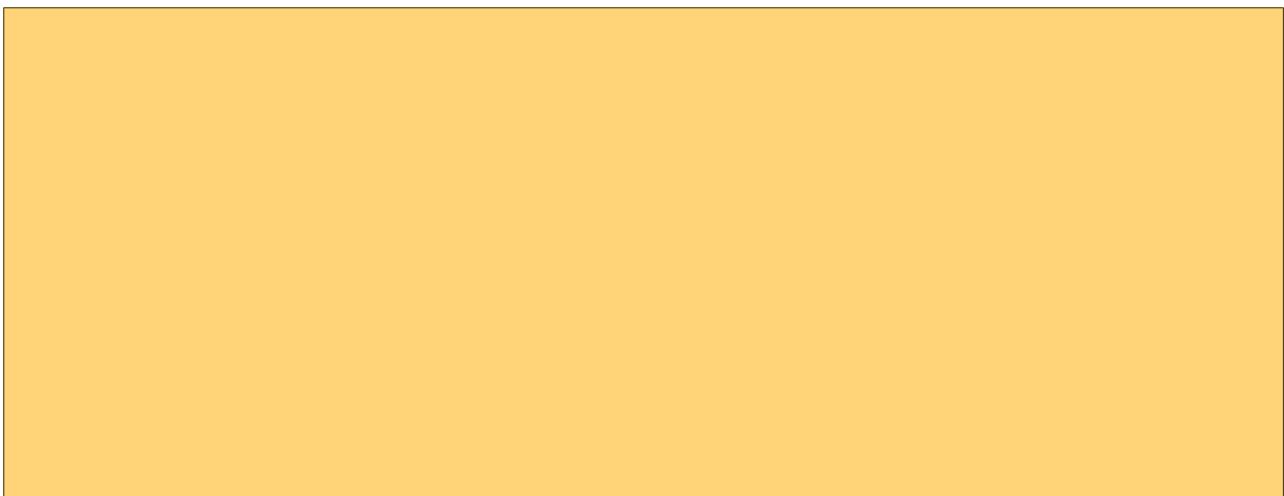

overlaySelect	org.primefaces.event.map.OverlaySelectEvent	When an overlay is selected.
stateChange	org.primefaces.event.map.StateChangeEvent	When map state changes.
pointSelect	org.primefaces.event.map.PointSelectEvent	When an empty point is selected.
markerDrag	org.primefaces.event.map.MarkerDragEvent	When a marker is dragged.

Following example displays a FacesMessage about the selected marker with growl component.

InfoWindow

A common use case is displaying an info window when a marker is selected. *gmapInfoWindow* is used to implement this special use case. Following example, displays an info window that contains an image of the selected marker data.

Street View

StreetView is enabled simply by setting *streetView* option to true.

Map Controls

Controls on map can be customized via attributes like `navigationControl` and `mapTypeControl`. Alternatively setting `disableDefaultUI` to true will remove all controls at once.

Native Google Maps API

In case you need to access native google maps api with javascript, use provided `getMap()` method.

Full map api is provided at;

<http://code.google.com/apis/maps/documentation/javascript/reference.html>

GMap API

`org.primefaces.model.map.MapModel` (`org.primefaces.model.map.DefaultMapModel` is the default implementation)

addOverlay(Overlay overlay)	Adds an overlay to map
List<Marker> getMarkers()	Returns the list of markers
List<Polyline> getPolylines()	Returns the list of polylines
List<Polygon> getPolygons()	Returns the list of polygons
List<Circle> getircles()	Returns the list of circles
List<Rectangle> getRectangles()	Returns the list of rectangles.
Overlay findOverlay(String id)	Finds an overlay by it's unique id

org.primefaces.model.map.Overlay

id	null	String	Id of the overlay, generated and used internally
data	null	Object	Data represented in marker
zindex	null	Integer	Z-Index of the overlay

org.primefaces.model.map.Marker extends *org.primefaces.model.map.Overlay*

title	null	String	Text to display on rollover
latlng	null	LatLng	Location of the marker
icon	null	String	Icon of the foreground
shadow	null	String	Shadow image of the marker
cursor	pointer	String	Cursor to display on rollover
draggable	0	Boolean	Defines if marker can be dragged
clickable	1	Boolean	Defines if marker can be dragged
flat	0	Boolean	If enabled, shadow image is not displayed
visible	1	Boolean	Defines visibility of the marker

org.primefaces.model.map.Polyline extends *org.primefaces.model.map.Overlay*

paths	null	List	List of coordinates
strokeColor	null	String	Color of a line
strokeOpacity	1	Double	Opacity of a line
strokeWeight	1	Integer	Width of a line

org.primefaces.model.map.Polygon extends *org.primefaces.model.map.Overlay*

paths	null	List	List of coordinates
strokeColor	null	String	Color of a line
strokeOpacity	1	Double	Opacity of a line
strokeWeight	1	Integer	Weight of a line
fillColor	null	String	Background color of the polygon
fillOpacity	1	Double	Opacity of the polygon

org.primefaces.model.map.Circle extends *org.primefaces.model.map.Overlay*

center	null	LatLng	Center of the circle
radius	null	Double	Radius of the circle.
strokeColor	null	String	Stroke color of the circle.
strokeOpacity	1	Double	Stroke opacity of circle.
strokeWeight	1	Integer	Stroke weight of the circle.
fillColor	null	String	Background color of the circle.
fillOpacity	1	Double	Opacity of the circle.

org.primefaces.model.map.Rectangle extends *org.primefaces.model.map.Overlay*

bounds	null	LatLngBounds	Boundaries of the rectangle.
strokeColor	null	String	Stroke color of the rectangle.
strokeOpacity	1	Double	Stroke opacity of rectangle.

strokeWidth	10	Integer	Stroke weight of the rectangle.
fillColor	null	String	Background color of the rectangle
fillOpacity	1	Double	Opacity of the rectangle.

org.primefaces.model.map.LatLng

lat	null	double	Latitude of the coordinate
lng	null	double	Longitude of the coordinate

org.primefaces.model.map.LatLngBounds

org.primefaces.event.map.PointSelectEvent

latLng	null	LatLng	Coordinates of the selected point

org.primefaces.event.map.StateChangeEvent

bounds	null	LatLngBounds	Boundaries of the map
zoomLevel	0	Integer	Zoom level of the map

org.primefaces.event.map.GeocodeEvent

3.52 GMapInfoWindow

GMapInfoWindow is used with GMap component to open a window on map when an overlay is selected.

Info

Tag	
Tag Class	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
maxWidth	null	Integer	Maximum width of the info window

Getting started with GMapInfoWindow

See GMap section for more information about how gmapInfoWindow is used.

3.53 GraphicImage

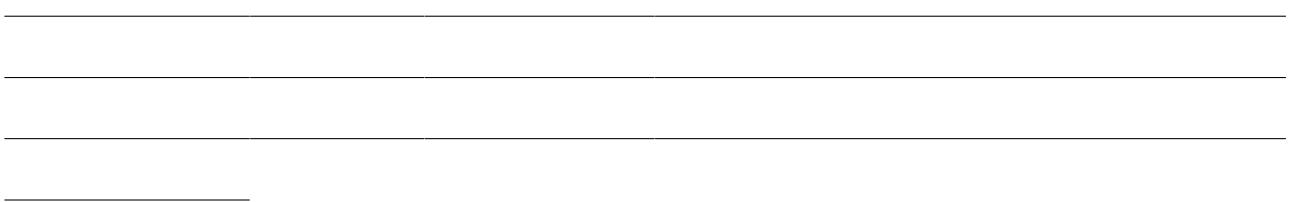

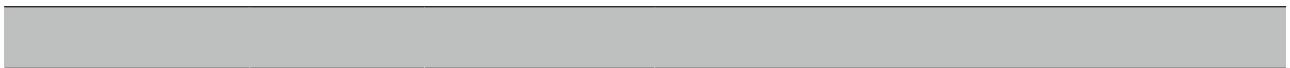

GraphicImage extends standard JSF graphic image component with the ability of displaying binary data like an inputstream. Main use cases of GraphicImage is to make displaying images stored in database or on-the-fly images easier. Legacy way to do this is to come up with a Servlet that does the streaming, GraphicImage does all the hard work without the need of a Servlet.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Binary data to stream or context relative path.
alt	null	String	Alternate text for the image
url	null	String	Alias to value attribute
width	null	String	Width of the image
height	null	String	Height of the image
title	null	String	Title of the image
dir	null	String	Direction of the text displayed
lang	null	String	Language code
ismap	false	Boolean	Specifies to use a server-side image map
usemap	null	String	Name of the client side map
style	null	String	Style of the image
styleClass	null	String	Style class of the image

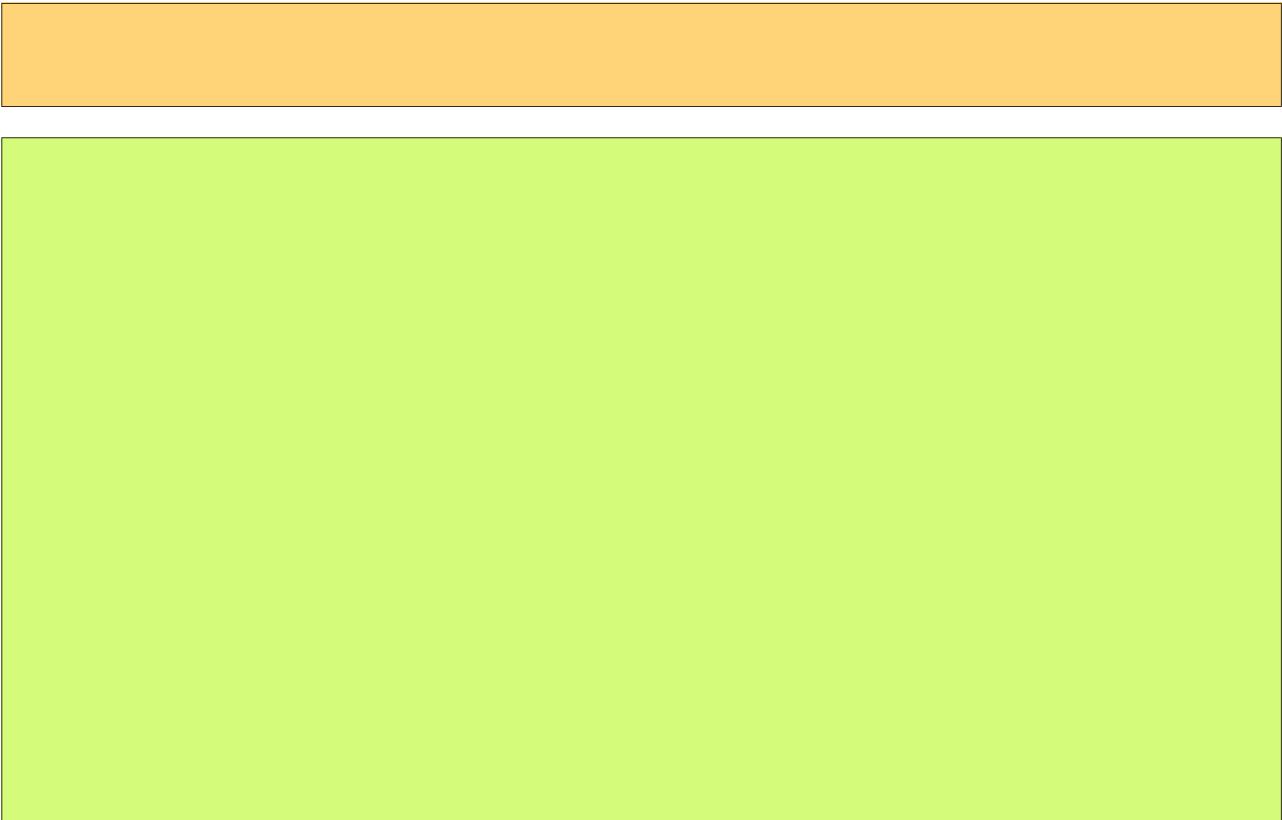

In a real life application, you can create the inputstream after reading the image from the database. For example `java.sql.ResultSet` API has the `getBinaryStream()` method to read blob files stored in database.

Displaying Charts with JFreeChart

See static images section at chart component for a sample usage of `graphicImage` with jFreeChart.

Displaying a Barcode

Similar to the chart example, a barcode can be generated as well. This sample uses barbecue project for the barcode API.

Displaying Regular Images

As `GraphicImage` extends standard `graphicImage` component, it can also display regular non dynamic images just like standard `graphicImage` component using name and optional library.

How It Works

Default dynamic image display works as follows;

- Streamed content is put in http session with an encrypted key
- This key is appended to the image url that points to JSF resource handler.

- Custom PrimeFaces ResourceHandler gets the key from the url, decrypts it to get the instance of StreamedContent from session, evaluates the content and streams it to client. Finally key is removed from http session.

As a result there will be 2 requests to display an image, at first browser will make a request to load the page initially and then another one to the dynamic image url that points to JSF resource handler. Note that you cannot use viewscope beans in this way as they are not available in resource loading request. See Data URI section below for an alternative to support view scope.

You can pass request parameters to the graphicImage via f:param tags, as a result the actual request rendering the image can have access to these values. This is extremely handy to display dynamic images if your image is in a data iteration component like datatable or ui:repeat.

ViewScope Support via Data URI

Setting stream attribute to false uses an alternative approach by converting the value to base64 and displays the image via data uri. In this approach, only one request is required so view scope is supported.

StreamedContent

There are two StreamedContent implementations out of the box; DefaultStreamedContent is not uses an InputStream and not serializable whereas the serializable ByteArrayContent uses a byte array.

3.54 Grid CSS

Grid CSS is a lightweight responsive layout utility optimized for mobile devices, tablets and desktops. Up to 12 columns are supported based on fluid layout.

Grid CSS

Grid CSS is a responsive layout utility optimized for mobile devices, tablets and desktops.

1	1	1	1	1	1	1	1	1	1	1	1	1
2		2		2		2		2		2		2
3			3			3		3			3	
4				4					4			
			6						6			
					12							
4						8						
3						9						
2				5					5			
4				2		2		3		1		

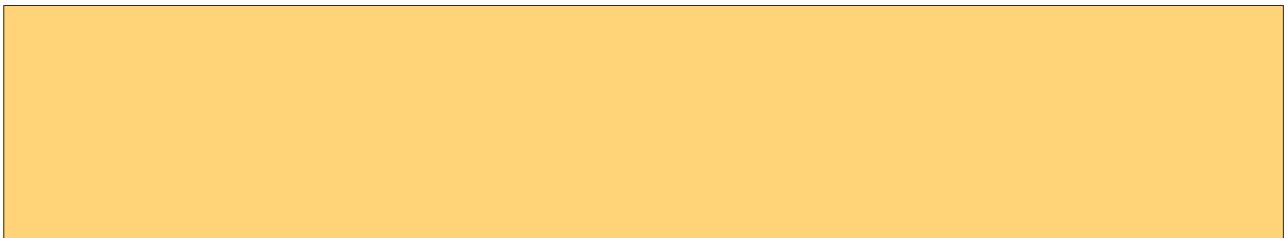

Getting Started with Grid

Grid CSS is based on a 12 column layout. Columns are prefixed with ui-g-* and they should be a descendant of a container having ui-g class. A simple 3 column layout can be defined as;

Multi Line

When the number of columns exceed 12, columns wrap to a new line.

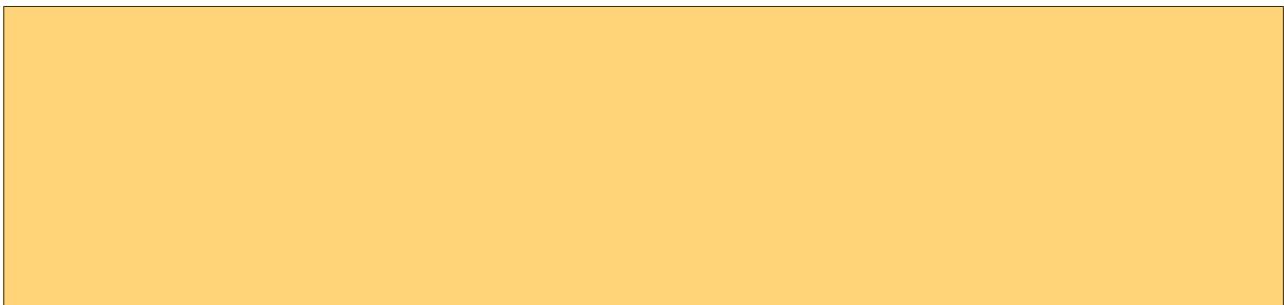

Same can also be achieved by having two ui-g containers to semantically define a row.

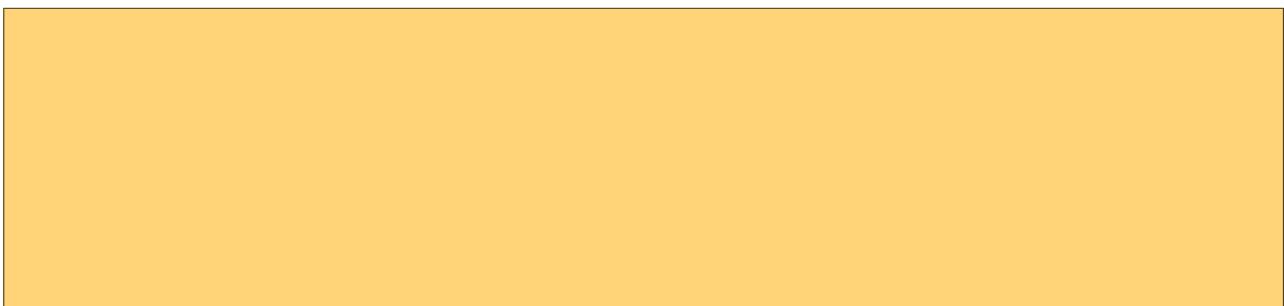

Nested

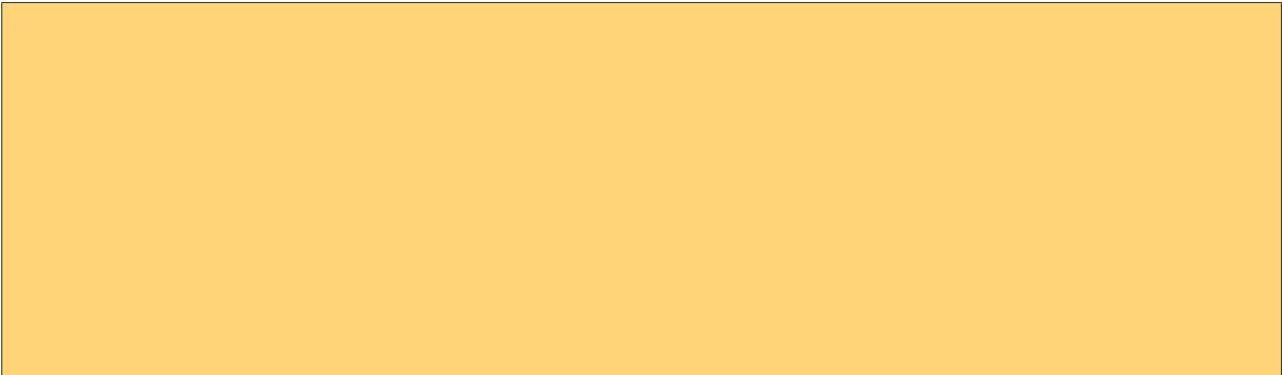

Columns can be nested to create more complex layouts.

Direct children of ui-g has the same height automatically, in example above if the inside columns is likely to have different height with different content.

Solution is wrapping the internal divs inside a ui-g as well.

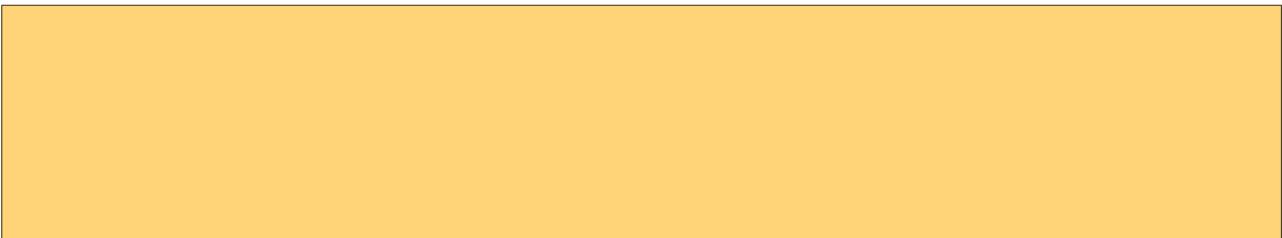

Responsive

Responsive layout is achieved by applying additional classes to the columns whereas ui-g-* define the default behavior. Four screen sizes are supported with different breakpoints.

ui-sm-*	Phones	max-width: 40em (640px)	ui-sm-6, ui-sm-4
ui-md-*	Tablets	min-width: 40.063em (641px)	ui-md-2, ui-sm-8
ui-lg-*	Desktops	min-width: 64.063em (1025px)	ui-lg-6, ui-sm-12
ui-xl-*	Big screen monitors	min-width: 90.063em (1441px)	ui-xl-2, ui-sm-10

Most of the time, ui-md-* styles are used with default ui-g-* classes, to customize small or large screens apply ui-sm, ui-lg and ui-xl can be utilized.

In example below, large screens display 4 columns, medium screens display 2 columns in 2 rows and default behavior gets only displayed in a mobile phone where each column is rendered in a separate row.

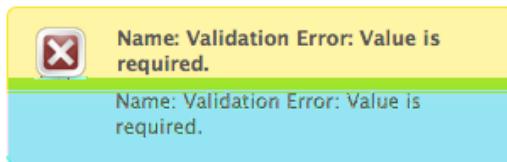

In this second example below, 3 columns are displayed in large screens and in medium screens first two columns are placed side by side where the last column displayed below them. In a mobile phone, they all get displayed in a separate row.

Note: A column has a default padding by default, to remove it you may apply ui-g-nopad style class.

3.55 Growl

Growl is based on the Mac's growl notification widget and used to display FacesMessages in an overlay.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
sticky	false	Boolean	Specifies if the message should stay instead of hidden automatically.
showSummary	true	Boolean	Specifies if the summary of message should be displayed.
showDetail	false	Boolean	Specifies if the detail of message should be displayed.
globalOnly	false	Boolean	When true, only facesmessages without clientids are displayed.
life	6000	Integer	Duration in milliseconds to display non-sticky messages.

autoUpdate	false	Boolean	Specifies auto update mode.
redisplay	true	Boolean	Defines if already rendered messaged should be displayed.
for	null	String	Name of associated key, takes precedence when used with globalOnly.
escape	true	Boolean	Defines whether html would be escaped or not.
severity	null	String	Comma separated list of severities to display only.

Getting Started with Growl

Growl usage is similar to standard h:messages component. Simply place growl anywhere on your page, since messages are displayed as an overlay, the location of growl in JSF page does not matter.

Lifetime of messages

By default each message will be displayed for 6000 ms and then hidden. A message can be made sticky meaning it'll never be hidden automatically.

If growl is not working in sticky mode, it's also possible to tune the duration of displaying messages. Following growl will display the messages for 5 seconds and then fade-out.

Growl with Ajax Updates

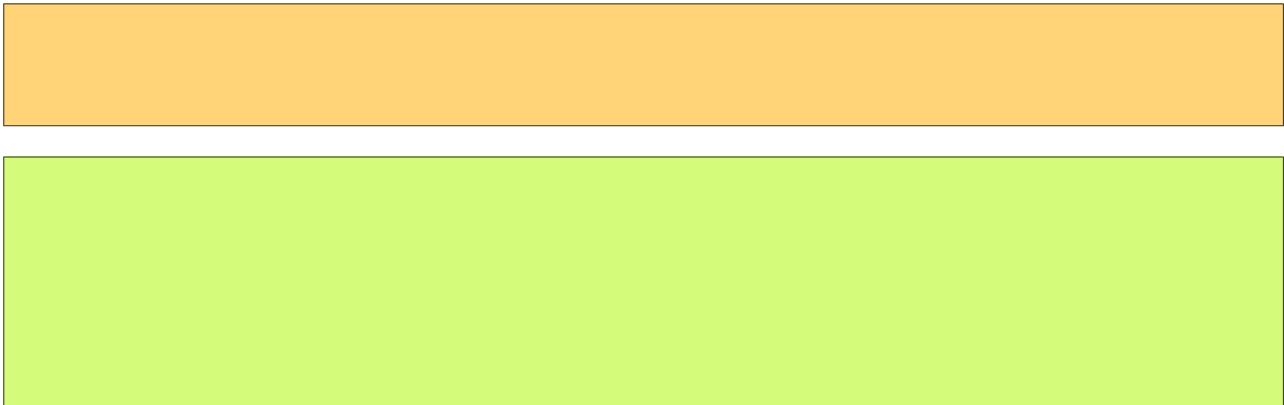

If you need to display messages with growl after an ajax request you just need to update it. Note that if you enable autoUpdate, growl will be updated automatically with each ajax request anyway.

Positioning

Growl is positioned at top right corner by default, position can be controlled with a CSS selector called *ui-growl*. W1JxVLEowl is not UÇt

Targetable Messages

There may be times where you need to target one or more messages to a specific message component, for example suppose you have growl and messages on same page and you need to display some messages on growl and some on messages. Use `for` attribute to associate messages with specific components.

In sample above, messages will display first and second message and growl will only display the 3rd message.

Severity Levels

Using severity attribute, you can define which severities can be displayed by the component. For instance, you can configure growl to only display infos and warnings.

Escaping

Growl escapes html content in messages, in case you need to display html via growl set escape option to false.

Skinning

Following is the list of structural style classes;

.ui-growl	Main container element of growl
.ui-growl-item-container	Container of messages
.ui-growl-item	Container of a message
.ui-growl-message	Text message container
.ui-growl-title	Summary of the message
.ui-growl-message p	Detail of the message
.ui-growl-image	Severity icon

.ui-growl-image-info	Info severity icon
.ui-growl-image-warn	Warning severity icon
.ui-growl-image-error	Error severity icon
.ui-growl-image-fatal	Fatal severity icon

As skinning style classes are global, see the main theming section for more information.

3.56 HeaderRow

HeaderRow is a helper component of datatable used for dynamic grouping.

Model	Year	Manufacturer	Color
20b7dd32	1983	Volvo	Orange
93583964	1962	Volvo	White
6e68d612	1970	Volvo	Brown
a127d75d	1968	Volvo	Black
3d5ba523	1994	Volvo	Red
Total:			51545\$
4d784acf	2002	Volkswagen	Red
0e43ef6e	1978	Volkswagen	Black
4b0ee961	1960	Volkswagen	Red
8b1bddef	2008	Volkswagen	White
Total:			80121\$
40b0c19d	2000	Renault	Green
a56ff6ee	1967	Renault	Maroon
ec645794	1983	Renault	Green
Total:			67468\$

Getting started with HeaderRow

See DataTable section for more information.

3.57 HotKey

HotKey is a generic key binding component that can bind any formation of keys to javascript event handlers or ajax calls.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
bind	null	String	The Key binding.
handler	null	String	Javascript event handler to be executed when the key binding is pressed.
action	null	MethodExpr	A method expression that'd be processed in the partial request caused by uiajax.
actionListener	null	MethodExpr	An actionlistener that'd be processed in the partial request caused by uiajax.
immediate	false	Boolean	Boolean value that determines the phaseId, when true actions are processed at apply_request_values, when false at invoke_application phase.
async	false	Boolean	When set to true, ajax requests are not queued.
process	null	String	Component id(s) to process partially instead of whole view.
update	null	String	Client side id of the component(s) to be updated after async partial submit request.
onstart	null	String	Javascript handler to execute before ajax request is

			begins.
oncomplete	null	String	Javascript handler to execute when ajax request is completed.
onsuccess	null	String	Javascript handler to execute when ajax request succeeds.
onerror	null	String	Javascript handler to execute when ajax request fails.
global	true	Boolean	Global ajax requests are listened by ajaxStatus component, setting global to false will not trigger ajaxStatus.
delay	null	String	If less than <i>delay</i> milliseconds elapses between calls to <i>request()</i> only the most recent one is sent and all other requests are discarded. If this option is not specified, or if the value of <i>delay</i> is the literal string 'none' without the quotes, no delay is used.
partialSubmit	false	Boolean	Enables serialization of values belonging to the partially processed components only.
partialSubmitFilter	null	String	Selector to use when partial submit is on, default is ":input" to select all descendant inputs of a partially processed components.
resetValues	false	Boolean	If true, local values of input components to be updated within the ajax request would be reset.
ignoreAutoUpdate	false	Boolean	If true, components which autoUpdate="true" will not be updated for this request. If not specified, or the value is false, no such indication is made.
timeout	0	Integer	Timeout for the ajax request in milliseconds.
form	null	String	Form to serialize for an ajax request. Default is the enclosing form.

Getting Started with HotKey

HotKey is used in two ways, either on client side with the event handler or with ajax support. Simplest example would be;

```
'a' => 'Pressed key a'
```

When this hotkey is on page, pressing the a key will alert the 'Pressed key a' text.

Key combinations

Most of the time you'd need key combinations rather than a single key.

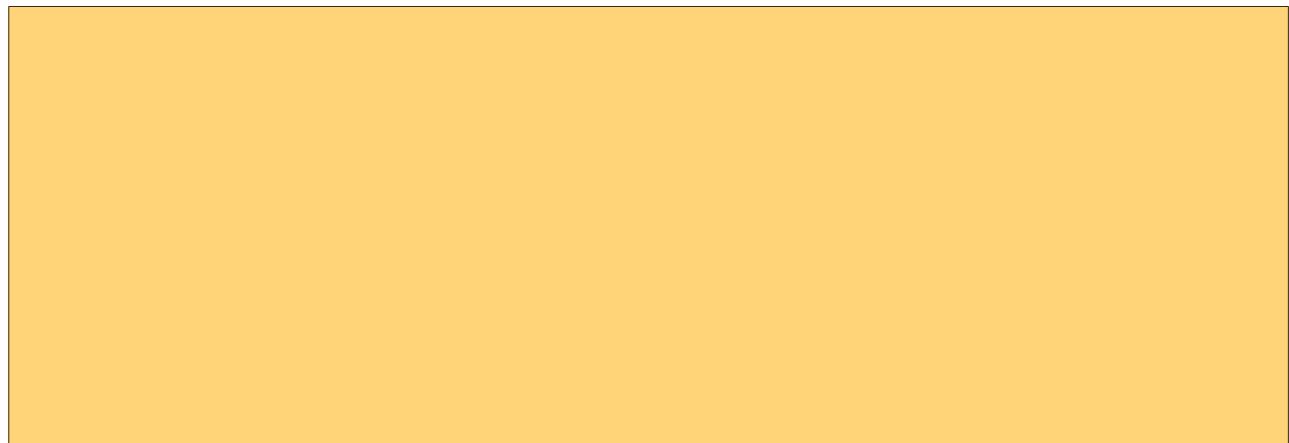

Integration

Here's an example demonstrating how to integrate hotkeys with a client side api. Using left and right keys will switch the images displayed via the p:imageSwitch component.

Ajax Support

Ajax is a built-in feature of hotKeys meaning you can do ajax calls with key combinations. Following form can be submitted with the *ctrl+shift+s* combination.

Note that hotkey will not be triggered if there is a focused input on page.

3.58 IdleMonitor

IdleMonitor watches user actions on a page and notify callbacks in case they go idle or active again.

Info

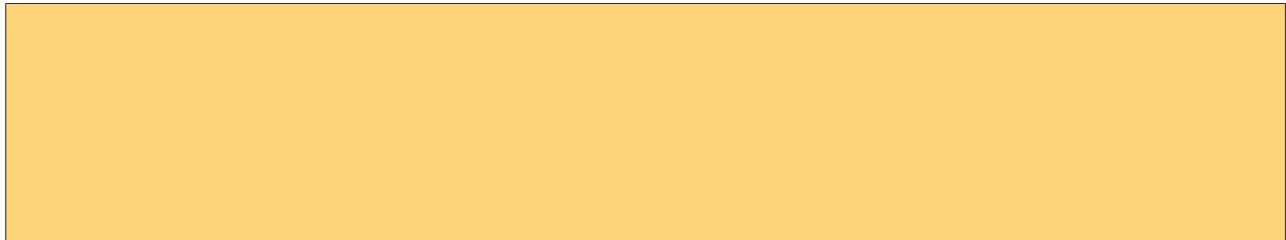

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
timeout	300000	Integer	Time to wait in milliseconds until deciding if the user is idle. Default is 5 minutes.
onidle	null	String	Client side callback to execute when user goes idle.
onactive	null	String	Client side callback to execute when user becomes active again.
widgetVar	null	String	Name of the client side widget.

Getting Started with IdleMonitor

To begin with, you can hook-in to client side events that are called when a user goes idle or becomes active again. Example below toggles visibility of a dialog to respond these events.

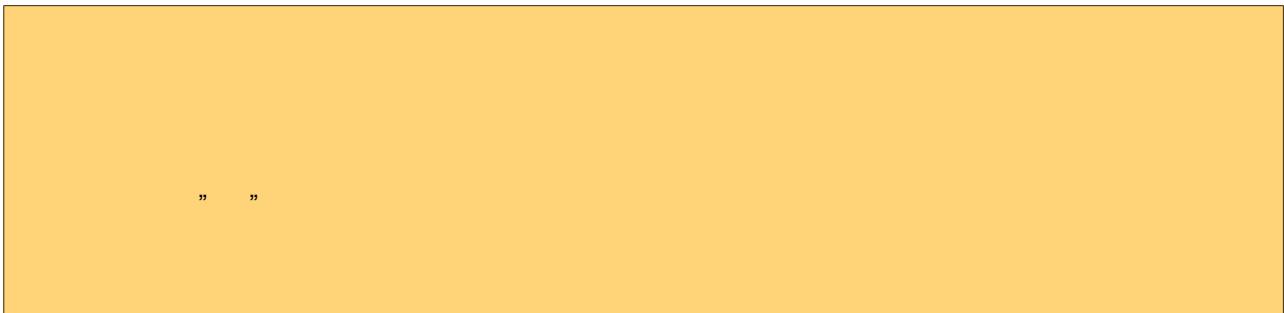

Controlling Timeout

By default, idleMonitor waits for 5 minutes (300000 ms) until triggering the onidle event. You can customize this duration with the timeout attribute.

Ajax Behavior Events

IdleMonitor provides two ajax behavior events which are *idle* and *active* that are fired according to user status changes. Example below displays messages for each event;

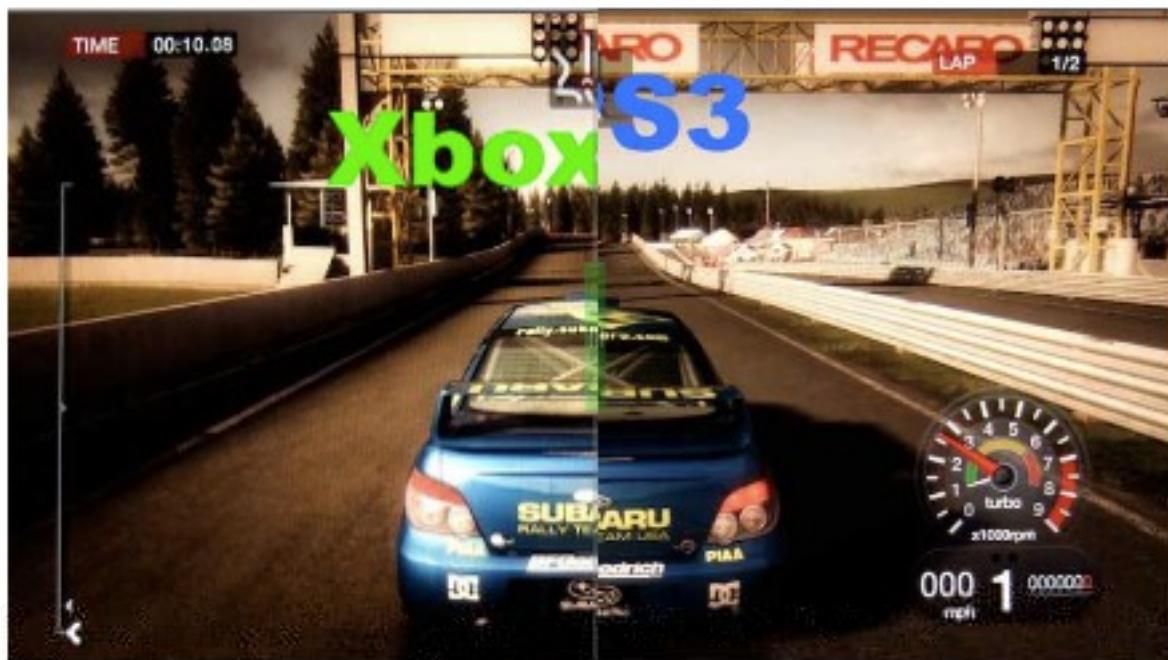

Client Side API

Widget: *PrimeFaces.widget.IdleMonitor*

pause()	-	void	Pauses the monitor.
resume()	-	void	Resumes monitoring
reset()	-	void	Resets the timer of monitor.

3.59 ImageCompare

ImageCompare provides a user interface to compare two images.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.

leftImage	null	String	Source of the image placed on the left side
rightImage	null	String	Source of the image placed on the right side
width	null	String	Width of the images
height	null	String	Height of the images
style	null	String	Inline style of the container element
styleClass	null	String	Style class of the container element

Getting started with ImageCompare

ImageCompare is created with two images with same height and width. It is required to set width and height of the images as well.

Skinning

Both images are placed inside a div container element, *style* and *styleClass* attributes apply to this element.

3.60 ImageCropper

ImageCropper allows cropping a certain region of an image. A new image is created containing the cropped area and assigned to a CroppedImage instanced on the server side.

Info

Renderer Class	

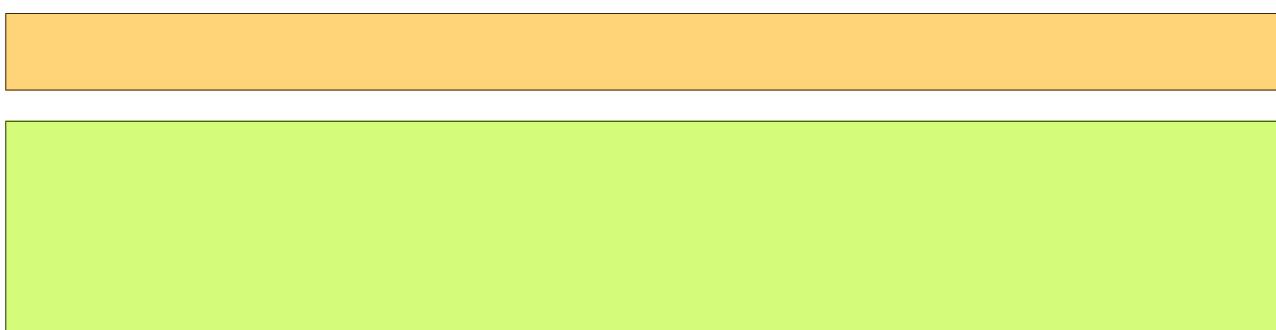

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component than can be either an EL expression of a literal text
converter	null	Converter /String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required

validator	null	Method Expr	A method binding expression that refers to a method validating the input
valueChangeListener	null	Method Expr	A method binding expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
image	null	String	Context relative path to the image.
alt	null	String	Alternate text of the image.
aspectRatio	null	Double	Aspect ratio of the cropper area.
minSize	null	String	Minimum size of the cropper area.
maxSize	null	String	Maximum size of the cropper area.
backgroundColor	null	String	Background color of the container.
backgroundOpacity	0,6	Double	Background opacity of the container
initialCoords	null	String	Initial coordinates of the cropper area.
boxWidth	0	Integer	Maximum box width of the cropping area.
boxHeight	0	Integer	Maximum box height of the cropping area.

Getting started with the ImageCropper

ImageCropper is an input component and image to be cropped is provided via the *image* attribute. The cropped area of the original image is used to create a new image, this new image can be accessed on the backing bean by setting the *value* attribute of the image cropper. Assuming the image is at %WEBAPP_ROOT%/campnou.jpg

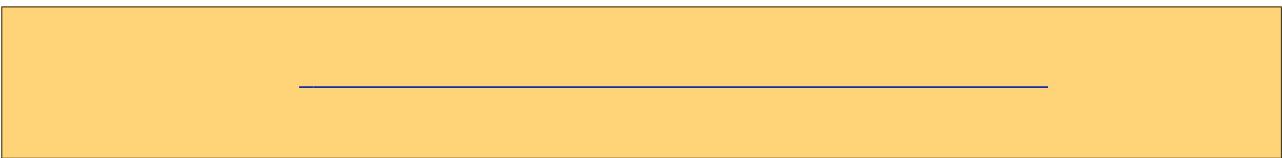

org.primefaces.model.CroppedImage belongs a PrimeFaces API and contains handy information about the crop process. Following table describes CroppedImage properties.

originalFileName	String	Name of the original file that's cropped
bytes	byte[]	Contents of the cropped area as a byte array
left	int	Left coordinate
right	int	Right coordinate
width	int	Width of the cropped image
height	int	Height of the cropped image

External Images

ImageCropper has the ability to crop external images as well.

Context Relative Path

For local images, ImageCropper always requires the image path to be context relative. So to accomplish this simply just add slash ("path/to/image.png") and imagecropper will recognize it at %WEBAPP_ROOT%/path/to/image.png. Action url relative local images are not supported.

Initial Coordinates

By default, user action is necessary to initiate the cropper area on an image, you can specify an initial area to display on page load using *initialCoords* option in *x,y,w,h* format.

Boundaries

minSize and maxSize attributes are control to limit the size of the area to crop.

Saving Images

Below is an example to save the cropped image to file system.

3.61 ImageSwitch

ImageSwitch component is a simple image gallery component.

Info

Tag

Attributes

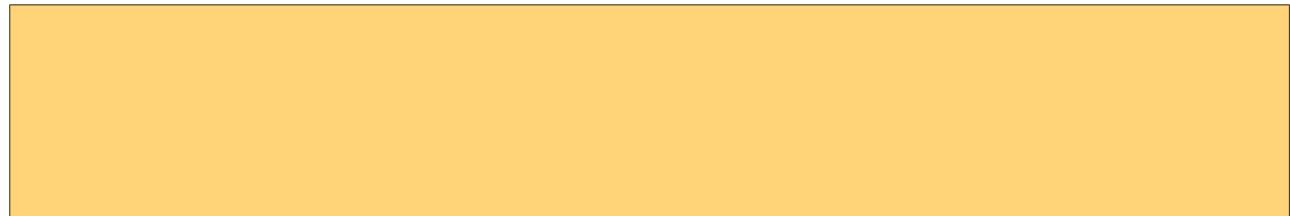

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>widgetVar</code>	null	String	Name of the client side widget.
<code>effect</code>	null	String	Name of the effect for transition.
<code>speed</code>	500	Integer	Speed of the effect in milliseconds.
<code>slideshowSpeed</code>	3000	Integer	Slideshow speed in milliseconds.
<code>slideshowAuto</code>	true	Boolean	Starts slideshow automatically on page load.
<code>style</code>	null	String	Style of the main container.
<code>styleClass</code>	null	String	Style class of the main container.
<code>activeIndex</code>	0	Integer	Index of the first image.

Getting Started with ImageSwitch

ImageSwitch component needs a set of images to display. Provide the image collection as a set of children components.

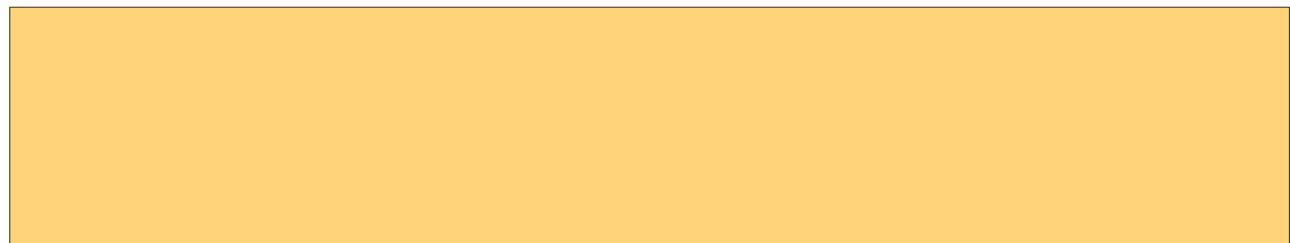

Most of the time, images could be dynamic, ui:repeat is supported to implement this case.

Slideshow or Manual

ImageSwitch is in slideShow mode by default, if you'd like manual transitions disable slideshow and use client side api to create controls.

Client Side API

Widget: *PrimeFaces.widget.ImageSwitch*

resumelideshow()	-	void	Starts slideshow mode.
stopSlideshow()	-	void	Stops slideshow mode.
toggleSlideshow()	-	void	Toggles slideshow mode.
pauseSlideshow()	-	void	Pauses slideshow mode.
next()	-	void	Switches to next image.
previous()	-	void	Switches to previous image.
switchTo(index)	index	void	Displays image with given index.

Effect Speed

The speed is considered in terms of milliseconds and specified via the speed attribute.

List of Effects

ImageSwitch supports a wide range of transition effects. Following is the full list, note that values are case sensitive.

- blindX
- blindY
- blindZ
- cover
- curtainX
- curtainY
- fade
- fadeZoom
- growX
- growY
- none
- scrollUp
- scrollDown
- scrollLeft
- scrollRight
- scrollVert
- shuffle
- slideX
- slideY
- toss
- turnUp
- turnDown
- turnLeft
- turnRight
- uncover
- wipe
- zoom

3.62 ImportConstants

In older EL versions (< 3.0), it's not possible to use constants or any other static fields/methods in an EL expression. As it is not really a good practice to create beans with getter/setter for each constants class. ImportConstant is an utility tag which allows to import constant fields in a page.

The constants can be accessed via the name of the class (default setting) or via a custom name (var attribute).

Info

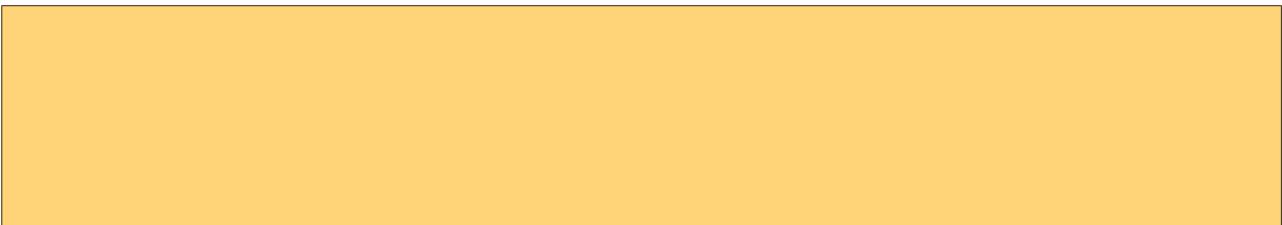

Tag	
Handler	

Attributes

type	null	String	Name of the class containing the constants.
var	null	String	Variable name to expose to EL.

Getting Started with ImportConstants

Class whose constants would be imported is defined with type property and the var property specifies the variable name to use via EL.

3.63 ImportEnum

In older EL versions (< 3.0), it's not possible to use enum constants or any other static fields/methods in an EL expression. As it is not really a good practice to create beans with getter/setter for each constants class, we provide an utils tag which allows to import enum values in a page.

The enum values can be accessed via the name of the class (default setting) or via a custom name (var attribute). It is also possible to get all enum values of the class with the "ALL_VALUES" suffix or a custom prefix via the "allSuffix" attribute.

Info

Tag	
Handler	

Attributes

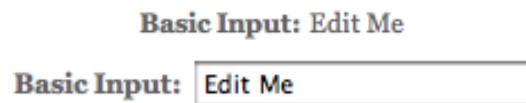

type	null	String	Name of the class containing the constants.
var	null	String	Variable name to expose to EL.
allSuffix	null	String	Suffix name to retrieve all values.

Getting Started with ImportEnum

Class whose enums would be imported is defined with type property and the var property specifies the variable name to use via EL.

3.64 Inplace

Inplace provides easy inplace editing and inline content display. Inplace consists of two members, display element is the initial clickable label and inline element is the hidden content that is displayed when display element is toggled.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
label	null	String	Label to be shown in display mode.
emptyLabel	null	String	Label to be shown in display mode when value is empty.
effect	fade	String	Effect to be used when toggling.
effectSpeed	normal	String	Speed of the effect.
disabled	false	Boolean	Prevents hidden content to be shown.
style	null	String	Inline style of the main container element.
styleClass	null	String	Style class of the main container element.
editor	false	Boolean	Specifies the editor mode.
saveLabel	Save	String	Tooltip text of save button in editor mode.

cancelLabel	Cancel	String	Tooltip text of cancel button in editor mode.
event	click	String	Name of the client side event to display inline content.
toggleable	true	Boolean	Defines if inplace is toggleable or not.

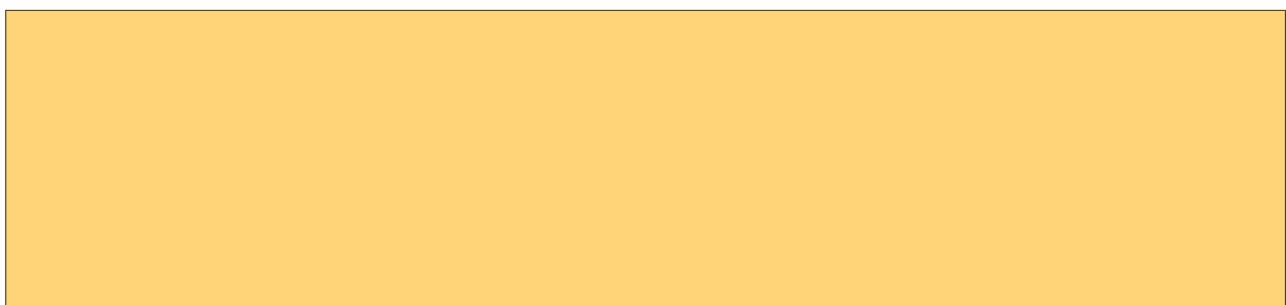

Getting Started with Inplace

The inline component needs to be a child of inplace.

Custom Labels

By default inplace displays its first child's value as the label, you can customize it via the label attribute.

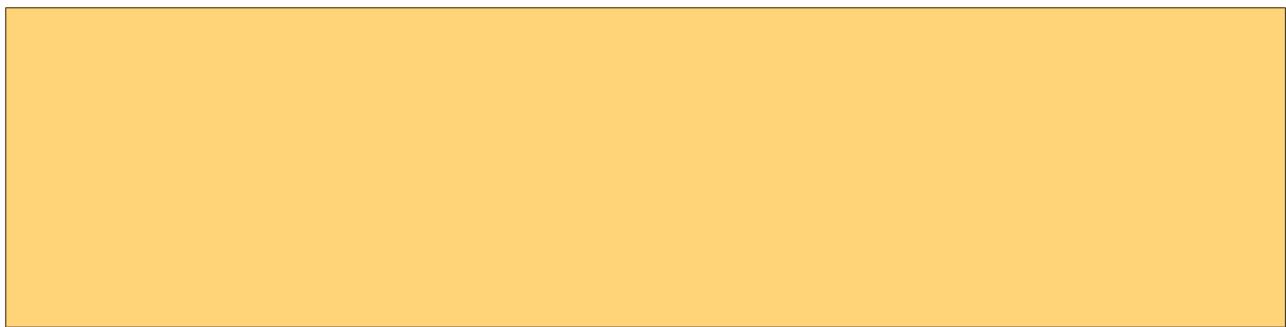

Select One: Cities

Select One: Istanbul ▾

Facets

For advanced customization, *output* and *input* facets are provided.

Effects

Default effect is *fade* and other possible effect is *slide*, also effect speed can be tuned with values *slow*, *normal* and *fast*.

Editor

Inplace editing is enabled via the *editor* option.

save and *cancel* are two provided ajax behaviors events you can use to hook-in the editing process.

Client Side API

Widget: *PrimeFaces.widget.Inplace*

show()	-	void	Shows content and hides display element.
hide()	-	void	Shows display element and hides content.
toggle()	-	void	Toggles visibility of between content and display element.
save()	-	void	Triggers an ajax request to process inplace input.
cancel()	-	void	Triggers an ajax request to revert inplace input.

Skinning

Inplace resides in a main container element which *style* and *styleClass* options apply. Following is the list of structural style classes;

.ui-inplace	Main container element.
.ui-inplace-disabled	Main container element when disabled.
.ui-inplace-display	Display element.
.ui-inplace-content	Inline content.
.ui-inplace-editor	Editor controls container.
.ui-inplace-save	Save button.
.ui-inplace-cancel	Cancel button.

As skinning style classes are global, see the main theming section for more information.

3.65 InputMask

InputMask forces an input to fit in a defined mask template.

Date:	<input type="text" value="11/12/2010"/>
Phone:	<input type="text" value="(523) 453-4253"/>
Phone with Ext:	<input type="text" value="(234) 532-4524 x35254"/>
taxId:	<input type="text" value="52-3434234"/>
SSN:	<input type="text" value="234-52-3452"/>
Product Key:	<input type="text" value="____-____-_____"/>

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
mask	null	String	Mask template
slotChar	null	String	PlaceHolder in mask template.
value	null	Object	Value of the component than can be either an EL expression of a literal text
converter	null	Converter/String	An el expression or a literal text that defines a converter for the component. When it's an EL

			expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required
validator	null	MethodExpr	A method binding expression that refers to a method validationg the input
valueChangeListener	null	MethodExpr	A method binding expression that refers to a method for handling a valuchangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
accesskey	null	String	Access key that when pressed transfers focus to the input element.
alt	null	String	Alternate textual description of the input field.
autocomplete	null	String	Controls browser autocomplete behavior.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
disabled	false	Boolean	Disables input field
label	null	String	A localized user presentable name.
lang	null	String	Code describing the language used in the generated markup for this component.
maxlength	null	Integer	Maximum number of characters that may be entered in this field.
onblur	null	String	Client side callback to execute when input element loses focus.
onchange	null	String	Client side callback to execute when input element loses focus and its value has been modified since gaining focus.
onclick	null	String	Client side callback to execute when input element is clicked.
ondblclick	null	String	Client side callback to execute when input element is double clicked.
onfocus	null	String	Client side callback to execute when input element receives focus.

onkeydown	null	String	Client side callback to execute when a key is pressed down over input element.
onkeypress	null	String	Client side callback to execute when a key is pressed and released over input element.
onkeyup	null	String	Client side callback to execute when a key is released over input element.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over input element
onmousemove	null	String	Client side callback to execute when a pointer button is moved within input element.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from input element.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto input element.
onmouseup	null	String	Client side callback to execute when a pointer button is released over input element.
onselect	null	String	Client side callback to execute when text within input element is selected by user.
placeholder	null	String	Specifies a short hint.
readonly	false	Boolean	Flag indicating that this component will prevent changes by the user.
size	null	Integer	Number of characters used to determine the width of the input element.
style	null	String	Inline style of the input element.
styleClass	null	String	Style class of the input element.
tabindex	null	Integer	Position of the input element in the tabbing order.
title	null	String	Advisory tooltip information.
autoClear	true	Boolean	Clears the field on blur when incomplete input is entered.

Getting Started with InputMask

InputMask below enforces input to be in 99/99/9999 date format.

Mask Samples

Here are more samples based on different masks;

Skinning

style and *styleClass* options apply to the displayed input element. As skinning style classes are global, see the main theming section for more information.

3.66 InputNumber

InputNumber formats input fields with numeric Strings. It supports currency symbols, minimum and maximum value, negative numbers, and a lot of round methods.

lang	null	String	Code describing the language used in the generated markup for this component.
maxlength	null	Integer	Maximum number of characters that may be entered in this field.
onblur	null	String	Client side callback to execute when input element loses focus.
onchange	null	String	Client side callback to execute when input element loses focus and its value has been modified since gaining focus.
onclick	null	String	Client side callback to execute when input element is clicked.
ondblclick	null	String	Client side callback to execute when input element is double clicked.
onfocus	null	String	Client side callback to execute on input element focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over input element.
onkeypress	null	String	Client side callback to execute when a key is pressed and released over input element.
onkeyup	null	String	Client side callback to execute when a key is released over input element.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over input element
onmousemove	null	String	Client side callback to execute when a pointer button is moved within input element.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from input element.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto input element.
onmouseup	null	String	Client side callback to execute when a pointer button is

			released over input element.
onselect	null	String	Client side callback to execute when text within input element is selected by user.
placeholder	null	String	Specifies a short hint.
readonly	0	Boolean	Flag indicating that this component will prevent changes by the user.
size	null	Integer	Number of characters used to determine the width of the input element.
style	null	String	Inline style of the input element.
styleClass	null	String	Style class of the input element.
tabindex	null	Integer	Position of the input element in the tabbing order.
title	null	String	Advisory tooltip information.
type	text	String	Input field type.
decimalSeparator	.	String	Decimal separator char.
thousandSeparator	,	String	Thousand separator char.
symbol	none	String	Desired symbol or unit.
symbolPosition	prefix	String	Position of the symbol.
minValue	0.00	String	Minimum value allowed
maxValue	999999 999.99	String	Maximum values allowed.
roundMethod	Round-Half-Up Symmetric	String	Controls the rounding method.
decimalPlaces			Number of decimal places. Default are taken from minValue and MaxValue.
emptyValue	empty	String	Controls empty input display behavior, options are empty, zero, sign.
inputStyle	null	String	Inline style of the input element.
inputStyleClass	null	String	Style class of the input element.
padControl	true	Boolean	Controls padding of the decimal places. If true, always pads the decimal with zeros.

Getting Started with InputNumber

Without any configuration, input number will parse the value and format it as a number using decimal and thousand separator.

Examples

Here are some examples demonstrating various cases;

Suffix currency symbol and comma for decimal separator

Maximum and minimum values (-1000.999 to 1000.000)

Custom decimal places

Empty value (empty) and required

Empty value (zero)

Empty value (sign)

15 Decimals using BigDecimal

3.67 InputSwitch

InputSwitch is used to select a boolean value.

converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
onLabel	on	String	Label for on state.
offLabel	off	String	Label for off state.
label	null	String	User presentable name.
disabled	null	String	Disables or enables the switch.
onchange	false	Boolean	Client side callback to execute on value change event.
style	null	String	Inline style of the main container.
styleClass	null	String	Style class of the main container.
tabindex	null	Integer	The tabindex attribute specifies the tab order of an element when the "tab" button is used for navigating.
showLabels	null	String	Controls the visibility of the labels, defaults to true.
onfocus	null	String	Client side callback to execute when component receives focus.
onblur	null	String	Client side callback to execute when component loses focus.

Getting started with InputSwitch

InputSwitch requires a boolean reference as the value.

Labels

Labels are customized using onLabel and offLabel options. Setting showLabels as false, turns off labels altogether.

Client Side API

Widget: *PrimeFaces.widget.InputSwitch*

toggle()	-	void	Toggles the state.
check()	-	void	Switches to on state.
uncheck()	-	void	Switches to off state.

Skinning

InputSwitch resides in a main container element which *style* and *styleClass* options apply. Following is the list of structural style classes;

.ui-inputswitch	Main container element.
.ui-inputswitch-off	Off state element.
.ui-inputswitch-on	On state element.
.ui-inputswitch-handle	Switch handle.

As skinning style classes are global, see the main theming section for more information.

3.68 InputText

InputText is an extension to standard inputText with skinning capabilities.

maxlength	null	Integer	Maximum number of characters that may be entered in this field.
counter	null	String	Id of the output component to display remaining chars.
counterTemplate	{0}	String	Template text to display in counter.
completeMethod	null	Method Expr	Method to provide suggestions.
minQueryLength	3	Integer	Number of characters to be typed to run a query.
queryDelay	700	Integer	Delay in ms before sending each query.
scrollHeight	null	Integer	Height of the viewport for autocomplete suggestions.

Getting Started with InputTextarea

InputTextarea usage is same as standard inputTextarea;

AutoResize

While textarea is being typed, if content height exceeds the allocated space, textarea can grow automatically. Use autoResize option to turn on/off this feature.

Remaining Characters

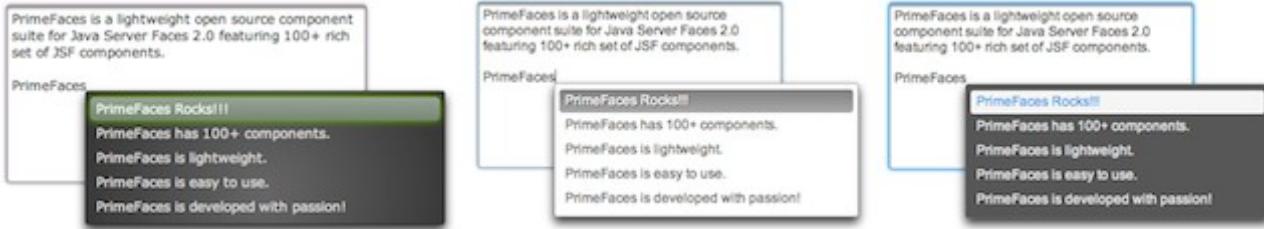

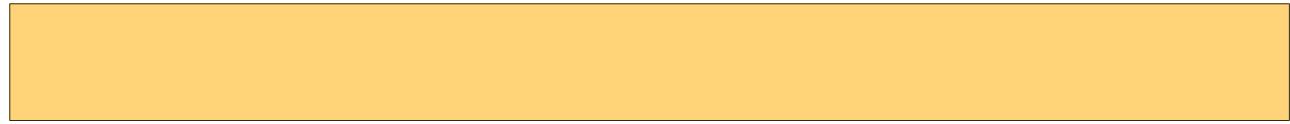

InputTextarea can limit the maximum allowed characters with maxLength option and display the remaining characters count as well.

AutoComplete

InputTextarea supports ajax autocomplete functionality as well. You need to provide a completeMethod to provide the suggestions to use this feature. In sample below, completeArea method will be invoked with the query being the four characters before the caret.

Skinning

InputTextarea renders a textarea element which *style* and *styleClass* options apply. Following is the list of structural style classes;

ui-inputtextarea	Textarea element.
ui-inputfield	Textarea element.
.ui-autocomplete-panel	Overlay for suggestions.
.ui-autocomplete-items	Suggestions container.
.ui-autocomplete-item	Each suggestion.

As skinning style classes are global, see the main theming section for more information.

3.70 Keyboard

Keyboard is an input component that uses a virtual keyboard to provide the input. Notable features are the customizable layouts and skinning capabilities.

Info

Tag	
Component Class	
Component Type

Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component than can be either an EL expression or a literal text
converter	null	Converter/String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required

onblur	null	String	Client side callback to execute when input element loses focus.
onchange	null	String	Client side callback to execute when input element loses focus and its value has been modified since gaining focus.
onclick	null	String	Client side callback to execute when input element is clicked.
ondbleclick	null	String	Client side callback to execute when input element is double clicked.
onfocus	null	String	Client side callback to execute when input element receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over input element.
onkeypress	null	String	Client side callback to execute when a key is pressed and released over input element.
onkeyup	null	String	Client side callback to execute when a key is released over input element.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over input element
onmousemove	null	String	Client side callback to execute when a pointer button is moved within input element.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from input element.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto input element.
onmouseup	null	String	Client side callback to execute when a pointer button is released over input element.
onselect	null	String	Client side callback to execute when text within input element is selected by user.
placeholder	null	String	Specifies a short hint.
readonly	false	Boolean	Flag indicating that this component will prevent changes by the user.
size	null	Integer	Number of characters used to determine the width of the input element.
style	null	String	Inline style of the input element.
styleClass	null	String	Style class of the input element.
tabindex	null	Integer	Position of the input element in the tabbing order.
title	null	String	Advisory tooltip information.

widgetVar	null	String	Name of the client side widget.

Getting Started with Keyboard

Keyboard is used just like a simple inputText, by default when the input gets the focus a keyboard is displayed.

Built-in Layouts

There're a couple of built-in keyboard layouts these are 'qwerty', 'qwertyBasic' and 'alphabetic'. For example keyboard below has the alphabetic layout.

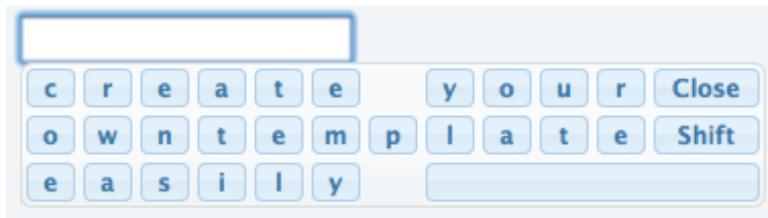

Custom Layouts

Keyboard has a very flexible layout mechanism allowing you to come up with your own layout.

Another example;

A layout template basically consists of built-in keys and your own keys. Following is the list of all built-in keys.

- back
- clear
- close
- shift
- spacebar
- space
- halfspace

All other text in a layout is realized as separate keys so "prime" would create 5 keys as "p" "r" "i" "m" "e". Use dash to separate each member in layout and use commas to create a new row.

Keypad

By default keyboard displays whole keys, if you only need the numbers use the keypad mode.

ShowMode

There're a couple of different ways to display the keyboard, by default keyboard is shown once input field receives the focus. This is customized using the showMode feature which accept values 'focus', 'button', 'both'. Keyboard below displays a button next to the input field, when the button is clicked the keyboard is shown.

Button can also be customized using the *buttonImage* and *buttonImageOnly* attributes.

3.71 KeyFilter

KeyFilter is used to filter keyboard input on specified input components.

Info

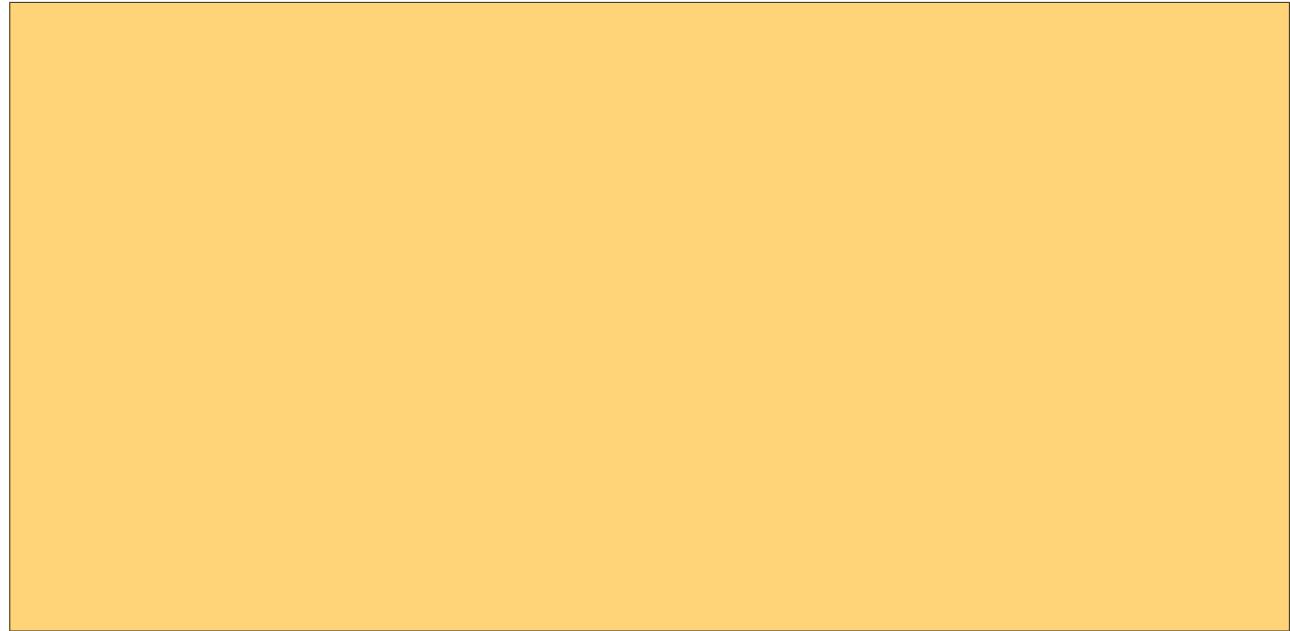

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component than can be either an EL expression or a literal text
widgetVar	null	String	Name of the client side widget.
for	null	String	The target input expression, defaults to parent.
regEx	null	String	Defines the regular expression which should be used for filtering the input.
inputRegEx	null	String	Defines the regular expression which should be used to test the complete input text content.
mask	null	String	Defines the predefined mask which should be used (pint, int, pnum, num, hex, email, alpha, alphanum).
testFunction	null	String	Defines a javascript code or function which should be used for filtering.
preventPaste	true	Boolean	Boolean value to specify if the component also should prevent paste.

Getting Started with KeyFilter

KeyFilter can either be attached to an input using for property or by being nested inside the target input component. Filtering is applied using regex, mask or testFunction properties.

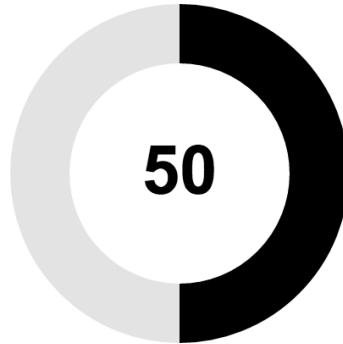

There are also predefined masks for common formats;

Mask	Pattern
pint	/[\d]/
int	/[\d\-/]/
pnum	/[\d\.\.]/
money	/[\d\.\.\s,]/
num	/[\d\-\.\.]/
hex	/[0-9a-f]/i
email	/[a-z0-9_\.\\-@]/i
alpha	/[a-zA-Z]/i
alphanum	/[a-zA-Z0-9]/i

3.72 Knob

Knob is an input component to insert numeric values in a range.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component than can be either an EL expression or a literal text
converter	null	Converter /String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required

validator	null	Method Expr	A method binding expression that refers to a method validating the input
valueChangeListener	null	Method Expr	A method binding expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed after failed validation.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
min	0	Integer	Min valid value of the component.
max	100	Integer	Max valid value of the component.
step	1	Integer	Increment/decrement step of the component.
thickness	null	Float	Thickness of the bar.
width	auto	String	Width of the component.
height	auto	String	Height of the component.
foregroundColor	null	Object	Foreground color of the component, you can use an hex value, a css constant or a java.awt.Color object
backgroundColor	null	Object	Background color of the component, you can use an hex value, a css constant or a java.awt.Color object.
colorTheme	null	String	Theme of the knob.
disabled	false	Boolean	Disables the input element
showLabel	true	Boolean	Set false to hide the label.
cursor	false	Boolean	Set true to show only a cursor instead of the full bar.
labelTemplate	{value}	String	Template of the progress value e.g. "{value}%"
onchange	null	String	Client side callback to invoke when value changes.

Getting Started with Knob

Knob is used as an input component with a value.

Boundaries and Step

Boundaries and step can be customized using min, max and step properties.

Label

Label at the center is visible by default and can be hidden by setting showLabel to false. In addition it can be customized using labelTemplate option.

Colors

Color scheme of the know are changed with foregroundColor and backgroundColor options.

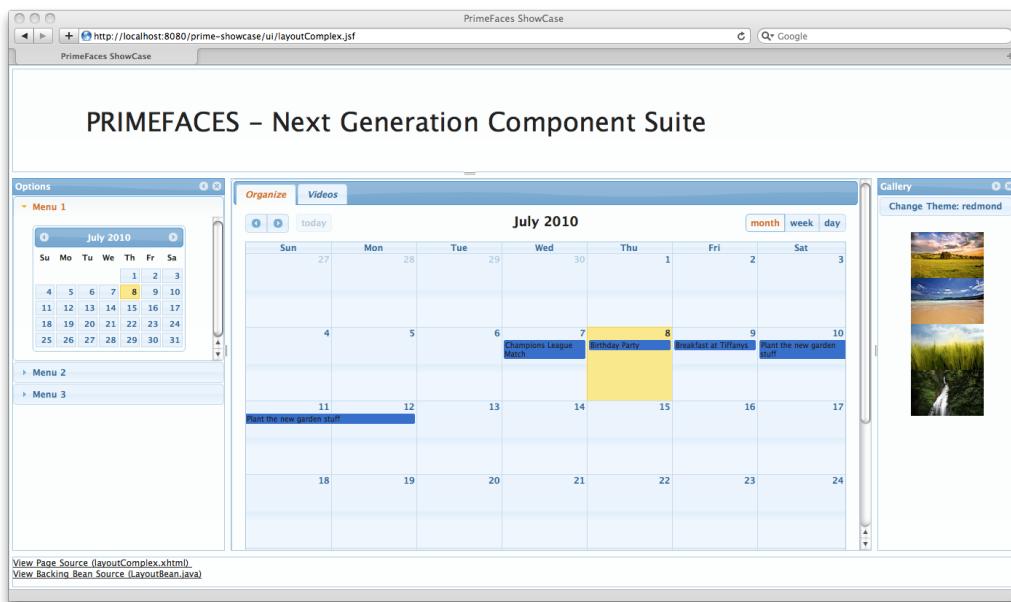

Client Side API

Widget: *PrimeFaces.widget.Knob*

setValue(value)	value	void	Updates the value with given value
getValue()	-	number	Returns the current knob value.
increment()	-	void	Increments current value by step factor.
Decrement(/	-	void	Decremenets current value by step factor.

3.73 Layout

Layout component features a highly customizable borderLayout model making it very easy to create complex layouts even if you're not familiar with web design.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

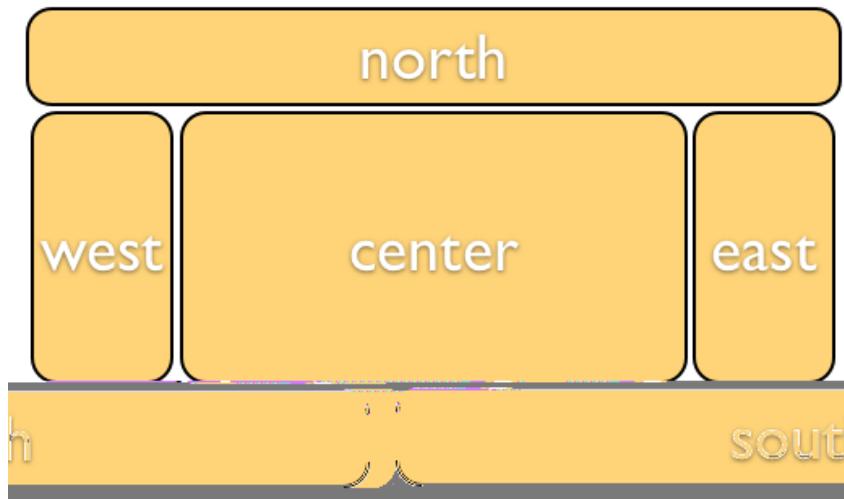

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
fullPage	false	Boolean	Specifies whether layout should span all page or not.

style	null	String	Style to apply to container element, this is only applicable to element based layouts.
styleClass	null	String	Style class to apply to container element, this is only applicable to element based layouts.
onResize	null	String	Client side callback to execute when a layout unit is resized.
onClose	null	String	Client side callback to execute when a layout unit is closed.
onToggle	null	String	Client side callback to execute when a layout unit is toggled.
resizeTitle	null	String	Title label of the resize button.
collapseTitle	null	String	Title label of the collapse button.
expandTitle	null	String	Title label of the expand button.
closeTitle	null	String	Title label of the close button.

Getting started with Layout

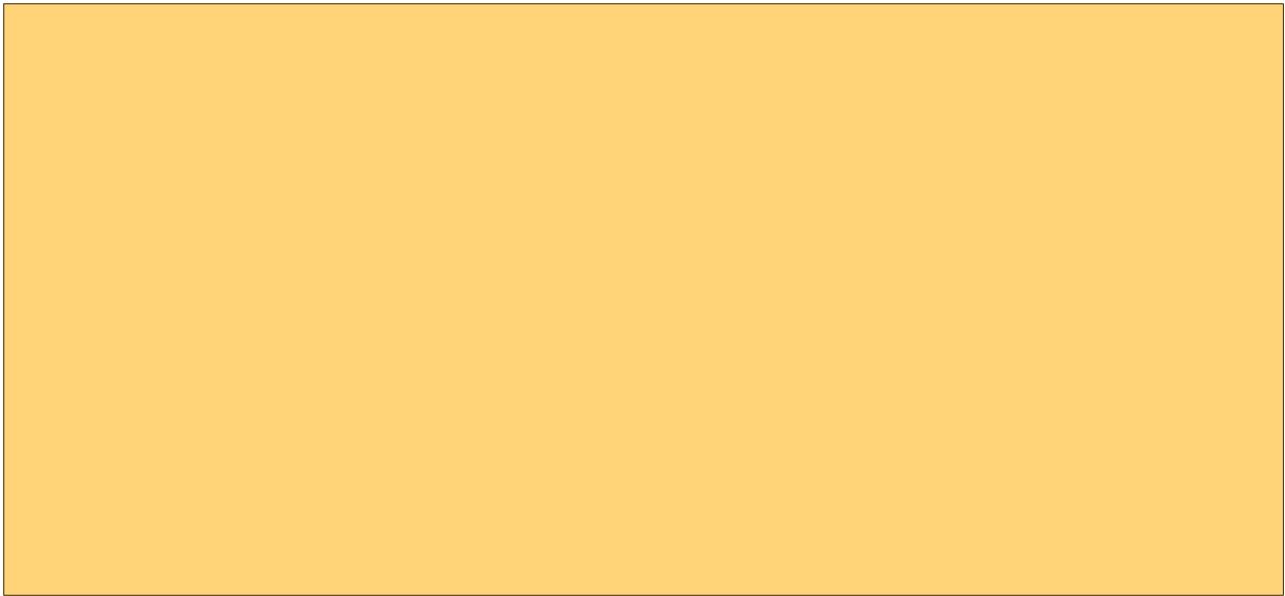

Layout is based on a borderLayout model that consists of 5 different layout units which are top, left, center, right and bottom. This model is visualized in the schema below;

Full Page Layout

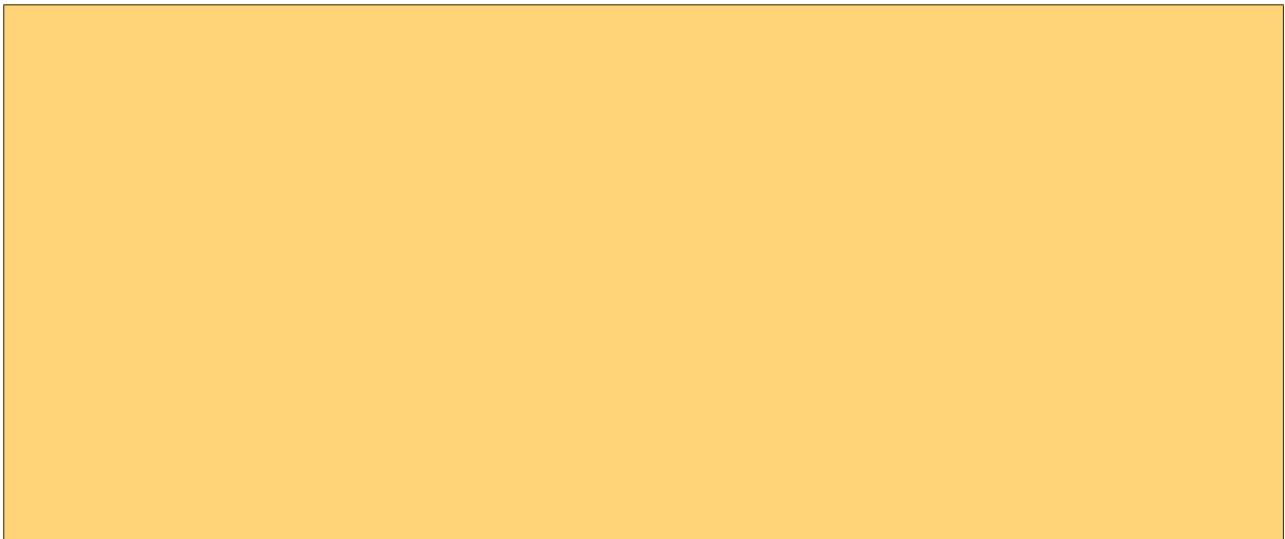

Layout has two modes, you can either use it for a full page layout or for a specific region in your page. This setting is controlled with the `fullPage` attribute which is false by default.

The regions in a layout are defined by `layoutUnits`, following is a simple full page layout with all possible units. Note that you can place any content in each layout unit.

Forms in Full Page Layout

When working with forms and full page layout, avoid using a form that contains layoutunits as generated dom may not be the same. So following is .

A layout unit must have it's own form instead, also avoid trying to update layout units because of same reason, update it's content instead.

Dimensions

Except center layoutUnit, other layout units have dimensions defined via *size* option.

Element based layout

Another use case of layout is the element based layout. This is the default case actually so just ignore fullPage attribute or set it to false. Layout example below demonstrates creating a split panel implementation.

Ajax Behavior Events

Layout provides custom ajax behavior events for each layout state change.

toggle	org.primefaces.event.ToggleEvent	When a unit is expanded or collapsed.
close	org.primefaces.event.CloseEvent	When a unit is closed.
resize	org.primefaces.event.ResizeEvent	When a unit is resized.

Stateful Layout

Making layout stateful would be easy, once you create your data to store the user preference, you can update this data using ajax event listeners provided by layout. For example if a layout unit is collapsed, you can save and persist this information. By binding this persisted information to the collapsed attribute of the layout unit layout will be rendered as the user left it last time.

Client Side API

Widget: *PrimeFaces.widget.Layout*

toggle(position)	position	void	Toggles layout unit.
show(position)	position	void	Shows layout unit.
hide(unit)	position	void	Hides layout unit.

Skinning

Following is the list of structural style classes:

.ui-layout	Main wrapper container element
.ui-layout-doc	Layout container
.ui-layout-unit	Each layout unit container
.ui-layout-{position}	Position based layout unit
.ui-layout-unit-header	Layout unit header
.ui-layout-unit-content	Layout unit body

As skinning style classes are global, see the main theming section for more information.

3.74 LayoutUnit

LayoutUnit represents a region in the border layout model of the Layout component.

Info

Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
position	null	String	Position of the unit.
size	null	String	Size of the unit.
resizable	false	Boolean	Makes the unit resizable.
closable	false	Boolean	Makes the unit closable.
collapsible	false	Boolean	Makes the unit collapsible.
header	null	String	Text of header.
footer	null	String	Text of footer.
minSize	null	Integer	Minimum dimension for resize.
maxSize	null	Integer	Maximum dimension for resize.
gutter	4px	String	Gutter size of layout unit.
visible	true	Boolean	Specifies default visibility
collapsed	false	Boolean	Specifies toggle status of unit
collapseSize	null	Integer	Size of the unit when collapsed

style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
effect	null	String	Effect name of the layout transition.
effectSpeed	null	String	Effect speed of the layout transition.

Getting started with LayoutUnit

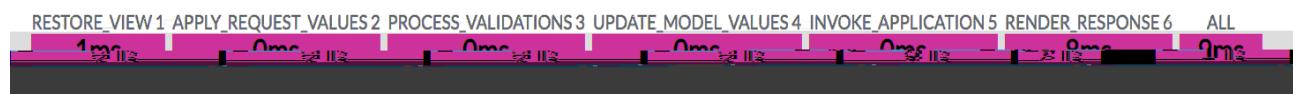

See layout component documentation for more information regarding the usage of layoutUnits.

Facets

In addition to *header* and *footer* attributes to display text at these locations, facets are also provided with the same name to display custom content.

3.75 Lifecycle

Lifecycle is a utility component which displays the execution time of each JSF phase. It also synchronizes automatically after each AJAX request.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.

Getting started with Lifecycle

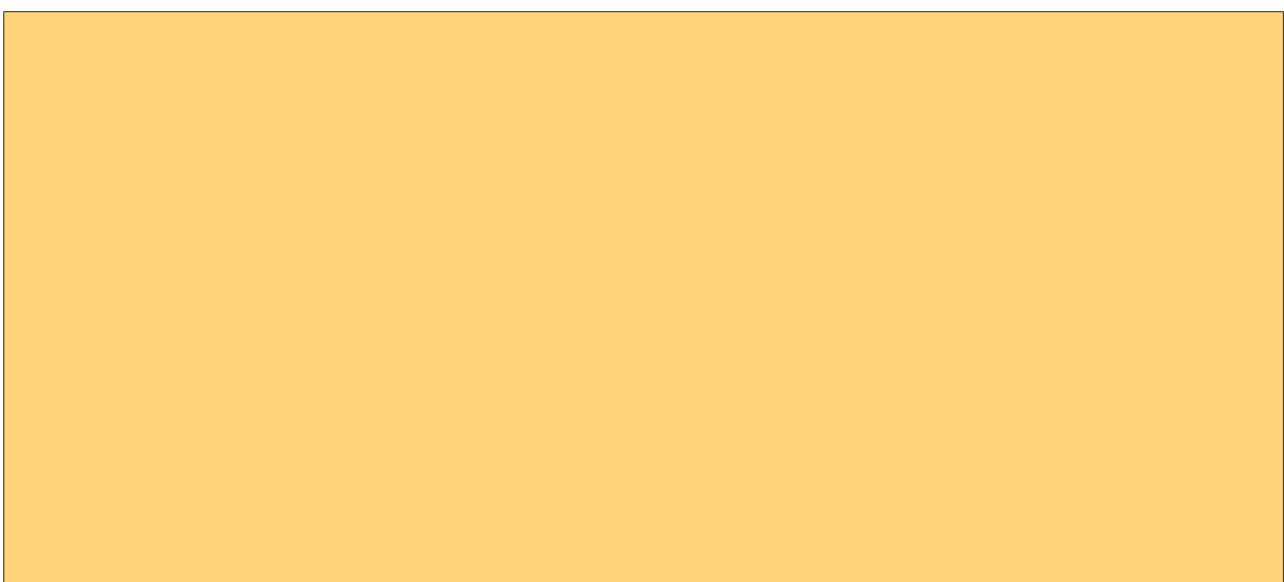

Lifecycle component is used simply as adding the component to the page.

height	null	String	Height of the overlay in iframe mode.
iframe	false	Boolean	Specifies an iframe to display an external url in overlay.
iframeTitle	null	String	Title of the iframe element.
visible	false	Boolean	Displays lightbox without requiring any user interaction by default.
onHide	null	String	Client side callback to execute when lightbox is displayed.
onShow	null	String	Client side callback to execute when lightbox is hidden.

Images

The images displayed in the lightBox need to be nested as child outputLink components. Following lightBox is displayed when any of the links are clicked.

IFrame Mode

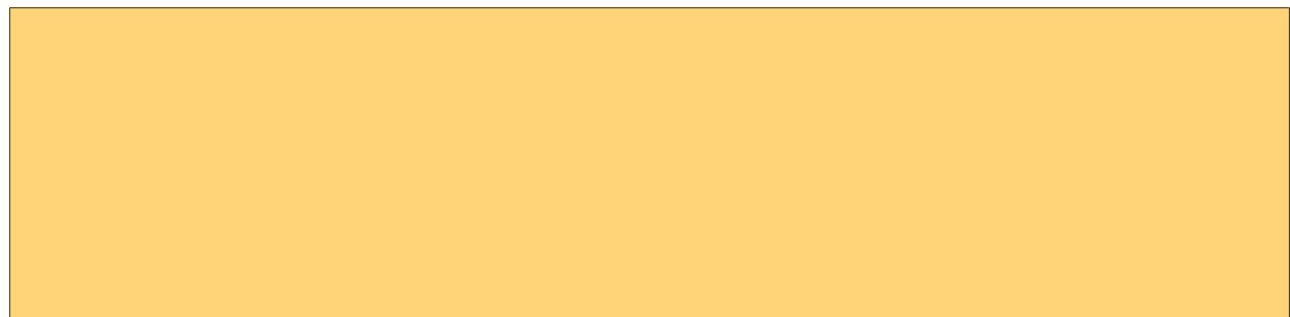

LightBox also has the ability to display iframes inside the page overlay, following lightbox displays the PrimeFaces homepage when the link inside is clicked.

Clicking the outputLink will display PrimeFaces homepage within an iframe.

Inline Mode

Inline mode acts like a modal dialog, you can display other JSF content on the page using the lightbox overlay. Simply place your overlay content in the "inline" facet. Clicking the link in the example below will display the panelGrid contents in overlay.

Lightbox inline mode doesn't support advanced content like complex widgets. Use a dialog instead for advanced cases involving custom content.

Client Side API

Widget: *PrimeFaces.widget.LightBox*

show()	-	void	Displays lightbox.
hide()	-	void	Hides lightbox.
showURL(opt)	opt	void	Displays a URL in a iframe. opt parameter has three variables. width and height for iframe dimensions and src for the page url.

Skinning

Lightbox resides in a main container element which *style* and *styleClass* options apply. Following is the list of structural style classes;

.ui-lightbox	Main container element.
.ui-lightbox-content-wrapper	Content wrapper element.
.ui-lightbox-content	Content container.
.ui-lightbox-nav-right	Next image navigator.
.ui-lightbox-nav-left	Previous image navigator.
.ui-lightbox-loading	Loading image.
.ui-lightbox-caption	Caption element.

3.77 Link

Link is an extension to standard h:link component.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
value	null	Object	Value of the component than can be either an EL expression or a literal text.
outcome	null	String	Used to resolve a navigation case.
includeViewParams	false	Boolean	Whether to include page parameters in target URI
fragment	null	String	Identifier of the target page which should be scrolled to.
disabled	false	Boolean	Disables button.
disableClientWindow	false	Boolean	Disable appending the ClientWindow on the rendering of this element.
accesskey	null	String	Access key that when pressed transfers focus to button.
charset	null	String	Character encoding of the resource designated by this hyperlink.
coords	null	String	Position and shape of the hot spot on the screen for client use in image maps.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
hreflang	null	String	Language code of the resource designated by the link.

rel	null	String	Relationship from the current document to the anchor specified by the link, values are provided by a space-separated list of link types.
rev	null	String	A reverse link from the anchor specified by this link to the current document, values are provided by a space-separated list of link types.
shape	null	String	Shape of hot spot on the screen, valid values are default, rect, circle and poly.
tabindex	null	String	Position of the element in the tabbing order.
target	null	String	Name of a frame where the resource targeted by this link will be displayed.
title	null	String	Advisory tooltip information.
type	null	String	Type of resource referenced by the link.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
onblur	null	String	Client side callback to execute when button loses focus.
onclick	null	String	Client side callback to execute when button is clicked.
ondblclick	null	String	Client side callback to execute when button is double clicked.
onfocus	null	String	Client side callback to execute when button receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over button.
onkeypress	null	String	Client side callback to execute when a key is pressed and released over button.
onkeyup	null	String	Client side callback to execute when a key is released over button.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over button.
onmousemove	null	String	Client side callback to execute when a pointer button is moved within button
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from button.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto button.
onmouseup	null	String	Client side callback to execute when a pointer button is released over button.
href	null	String	Inline style of the button.

escape	true	Boolean	Defines if label of the component is escaped or not.

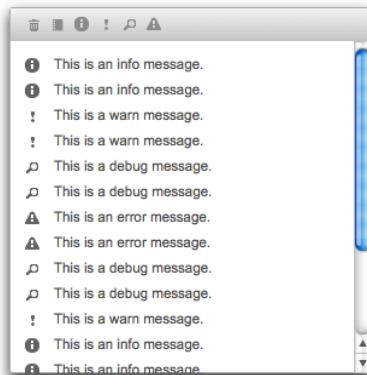

Getting Started with Link

p:link usage is same as standard h:link, an outcome is necessary to navigate using GET requests. Assume you are at source.xhtml and need to navigate target.xhtml.

To navigate without outcome based approach, use href attribute.

3.78 Log

Log component is a visual console to display logs on JSF pages.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean

Getting started with Log

Log component is used simply as adding the component to the page.

Log API

PrimeFaces uses client side log apis internally, for example you can use log component to see details of an ajax request. Log API is also available via global PrimeFaces object in case you'd like to use the log component to display your logs.

If project stage is development, log messages are also available at browser console.

Client Side API

Widget: *PrimeFaces.widget.Log*

show()	-	void	Show the container element.
hide()	-	void	Hides the container element.

3.79 Media

Media component is used for embedding multimedia content.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
value	null	String	Media source to play.
player	null	String	Type of the player, possible values are "quicktime", "windows", "flash", "real" and "pdf".
width	null	String	Width of the player.
height	null	String	Height of the player.
style	null	String	Style of the player.
styleClass	null	String	StyleClass of the player.
cache	true	Boolean	Controls browser caching mode of the resource.

Getting started with Media

In its simplest form media component requires a source to play;

Player Types

By default, players are identified using the value extension so for instance mov files will be played by quicktime player. You can customize which player to use with the player attribute.

Following is the supported players and file types.

windows	asx, asf, avi, wma, wmv
quicktime	aif, aiff, aac, au, bmp, gsm, mov, mid, midi, mpg, mpeg, mp4, m4a, psd, qt, qtif, qif, qti, snd, tif, tiff, wav, 3g2, 3pg
flash	flv, mp3, swf
real	ra, ram, rm, rpm, rv, smi, smil
pdf	pdf

Parameters

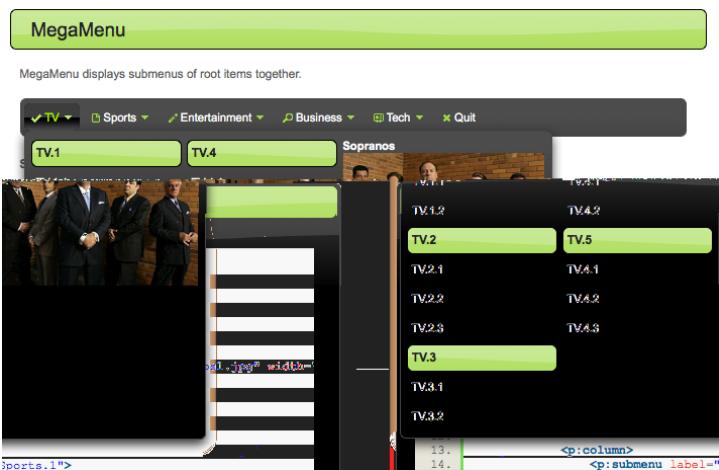

Different proprietary players might have different configuration parameters, these can be specified using f:param tags.

StreamedContent Support

Media component can also play binary media content, example for this use case is storing media files in database using binary format. In order to implement this, bind a StreamedContent.

3.80 MegaMenu

MegaMenu is a horizontal navigation component that displays submenus together.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

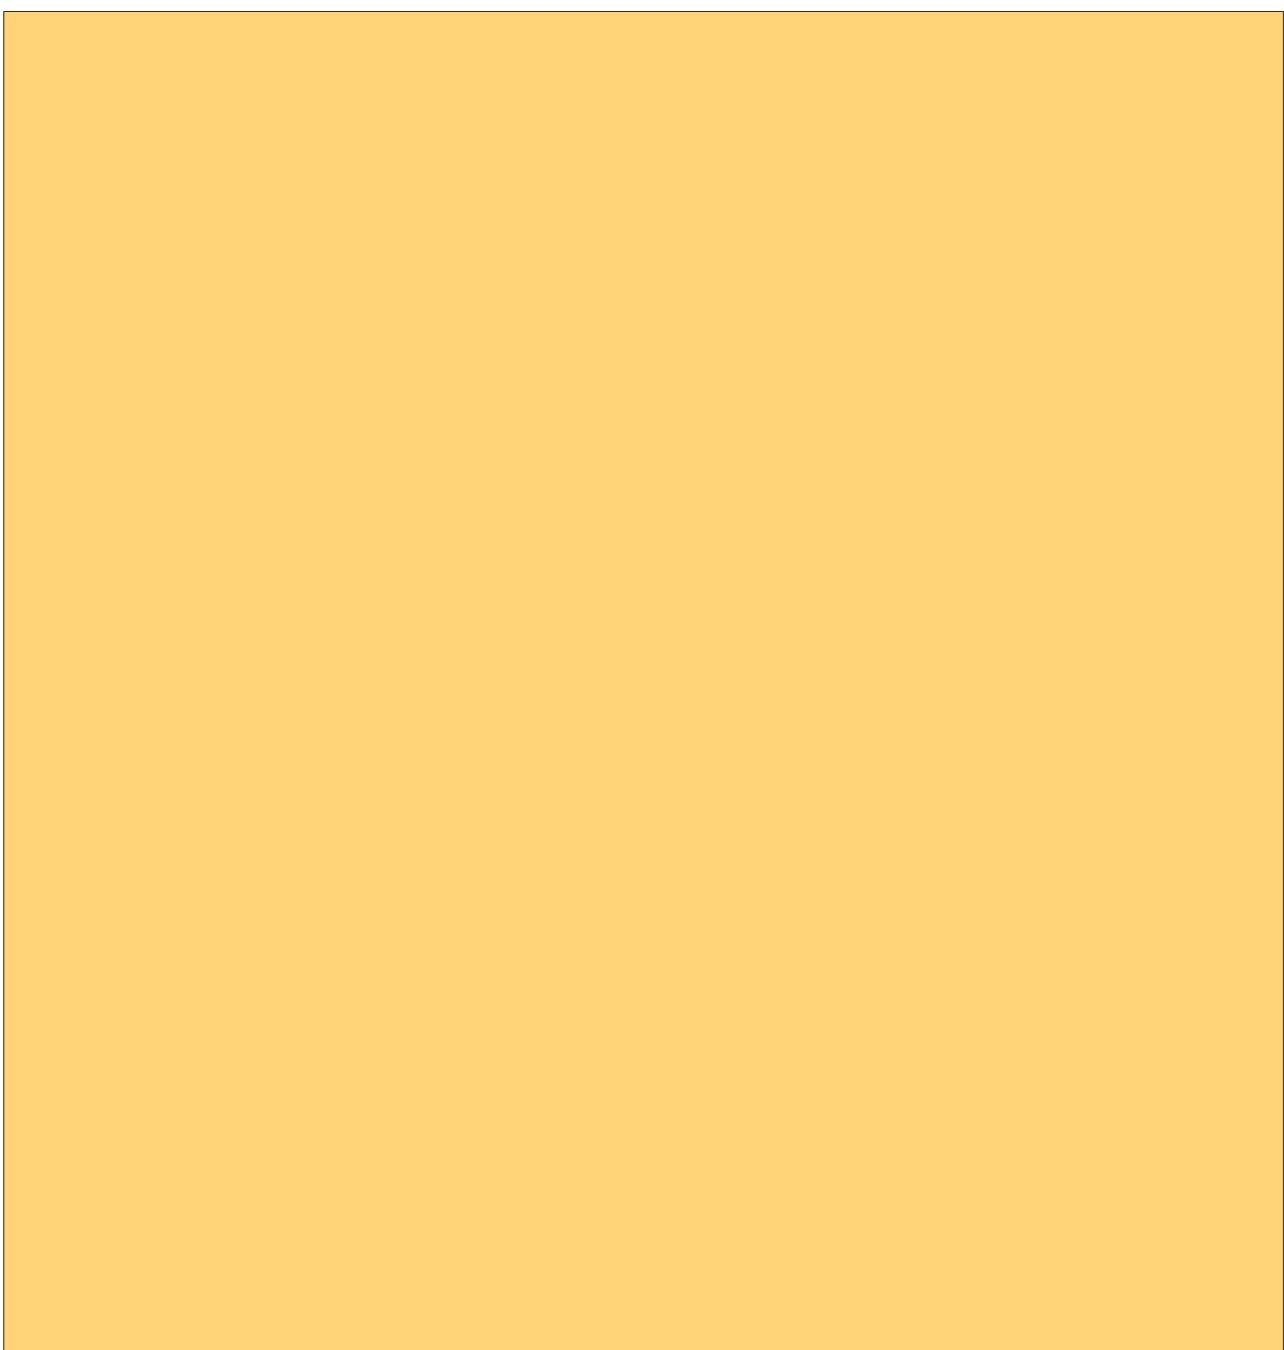

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
widgetVar	null	String	Name of the client side widget
model	null	MenuModel	MenuModel instance to create menus programmatically
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.

autoDisplay	true	Boolean	Defines whether submenus will be displayed on mouseover or not. When set to false, click event is required to display.
activeIndex	null	Integer	Index of the active root menu to display as highlighted. By default no root is highlighted.
orientation	horizontal	String	Defines the orientation of the root menuitems, valid values are "horizontal" and "vertical".

Getting Started with MegaMenu

Layout of MegaMenu is grid based and root items require columns as children.

Custom Content

Any content can be placed inside columns.

Root MenuItem

MegaMenu supports menuItem as root menu options as well. Following example allows a root menubar item to execute an action to logout the user.

Dynamic Menus

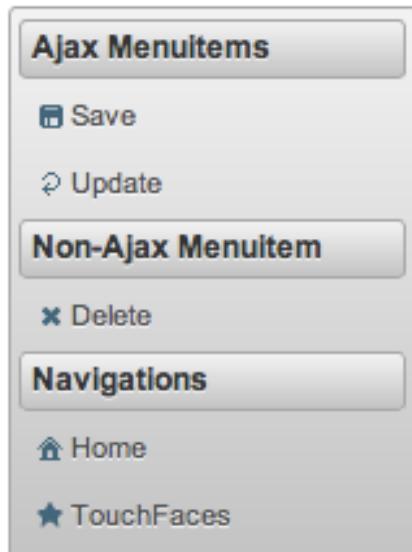

Menus can be created programmatically as well, see the dynamic menus part in menu component section for more information and an example.

Skinning

3.81 Menu

Menu is a navigation component with submenus and menuitems.

Info

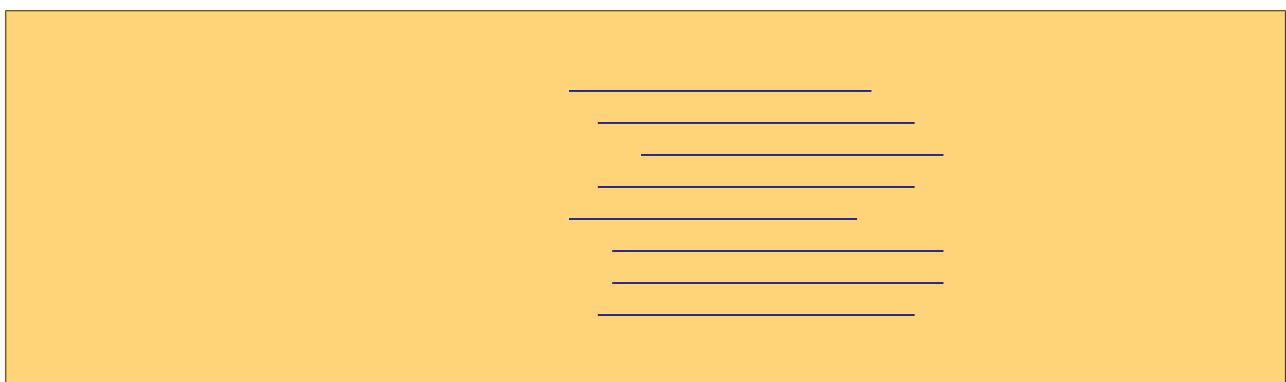

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

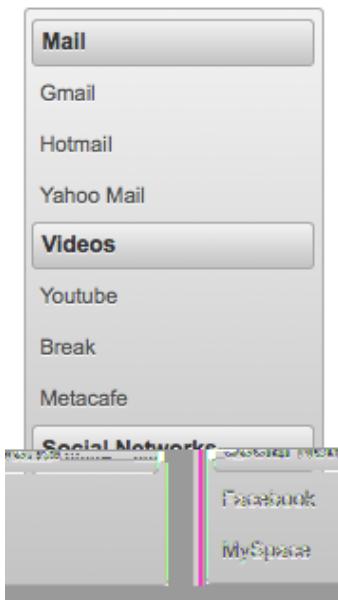

my	null	String	Corner of menu to align with trigger element.
at	null	String	Corner of trigger to align with menu element.
overlay	false	Boolean	Defines positioning type of menu, either static or overlay.
style	null	String	Inline style of the main container element.
styleClass	null	String	Style class of the main container element.
triggerEvent	click	String	Event to show the dynamic positioned menu.
tabindex	0	String	Position of the element in the tabbing order. Default is 0.
toggleable	false	Boolean	Defines whether clicking the header of a submenu toggles the visibility of children menuitems.

Getting started with the Menu

A menu is composed of submenus and menuitems.

Submenus are used to group menuitems;

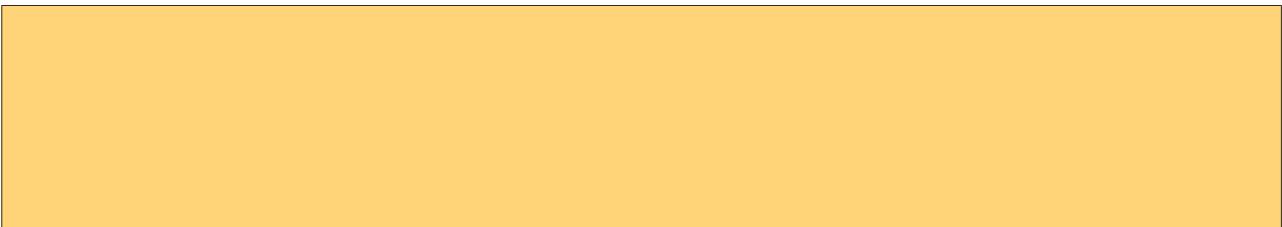

Overlay Menu

Menu can be positioned on a page in two ways; "static" and "dynamic". By default it's static meaning the menu is in normal page flow. In contrast dynamic menus is not on the normal flow of the page allowing them to overlay other elements.

A dynamic menu is created by setting *overlay* option to true and defining a trigger to show the menu. Location of menu on page will be relative to the trigger and defined by my and at options that take combination of four values;

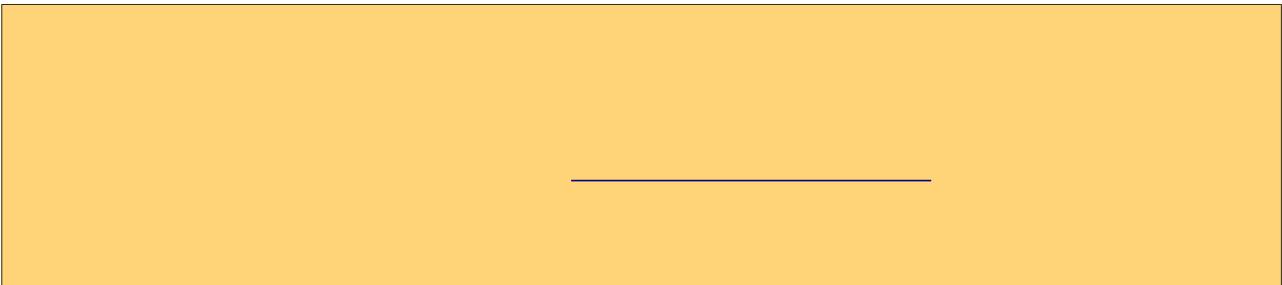

- left
- right
- bottom
- top

For example, clicking the button below will display the menu whose top left corner is aligned with bottom left corner of button.

Ajax and Non-Ajax Actions

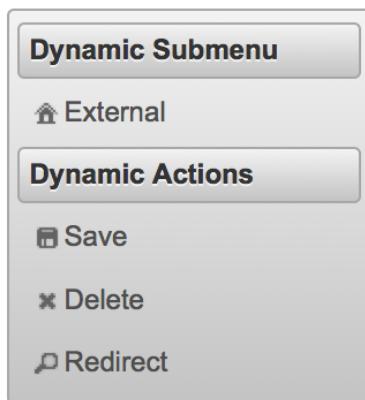

As menu uses menuitems, it is easy to invoke actions with or without ajax as well as navigation. See menuitem documentation for more information about the capabilities.

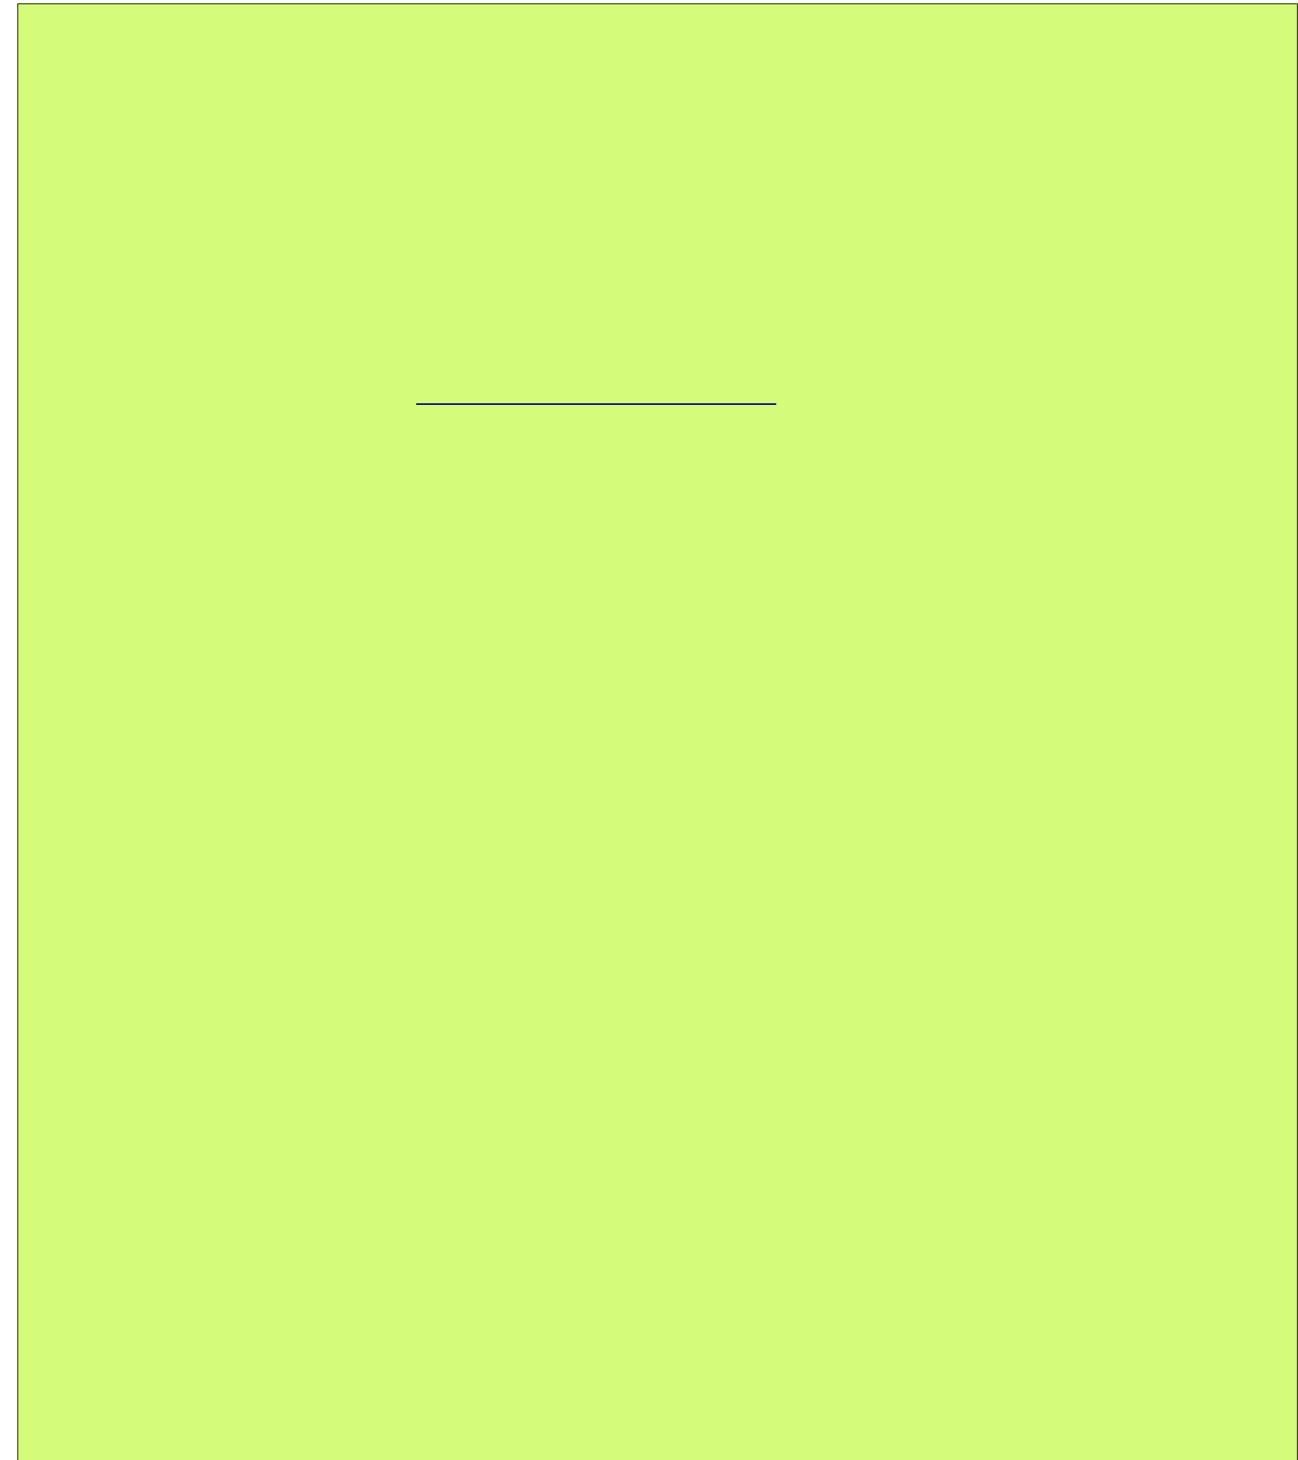

Dynamic Menus

Menus can be created programmatically as well, this is more flexible compared to the declarative approach. Menu metadata is defined using an `org.primefaces.model.MenuModel` instance, PrimeFaces provides the built-in `org.primefaces.model.DefaultMenuModel` implementation.

For further customization you can also create and bind your own `MenuModel` implementation. (e.g. One with JPA `@Entity` annotation to able able to persist to a database).

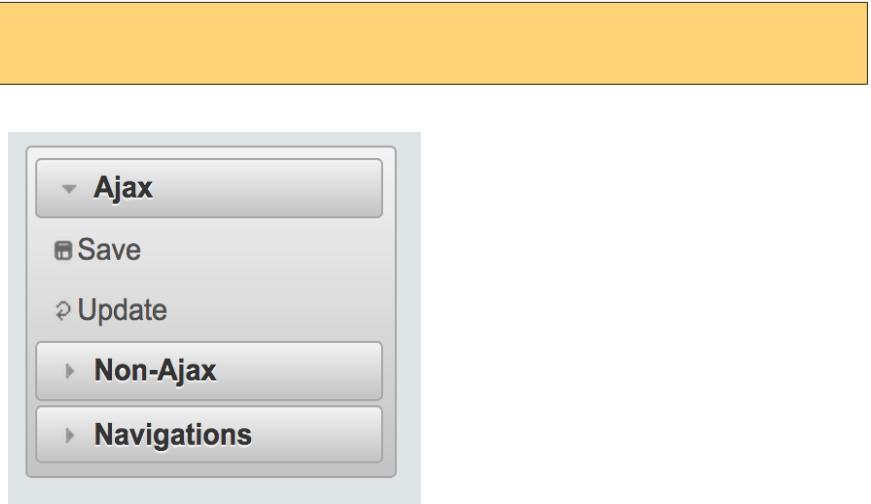

For all UI component counterpart such as p:menuitem, p:submenu, p:separator a corresponding interface with a default implementation exists in MenuModel API. Regarding actions, if you need to pass parameters in ajax or non-ajax commands, use setParam(key, value) method.

MenuModel API is supported by all menu components that have model attribute.

Toggleable

Enabling toggleable option makes the header of submenus clickable to expand and collapse their content.

Skinning

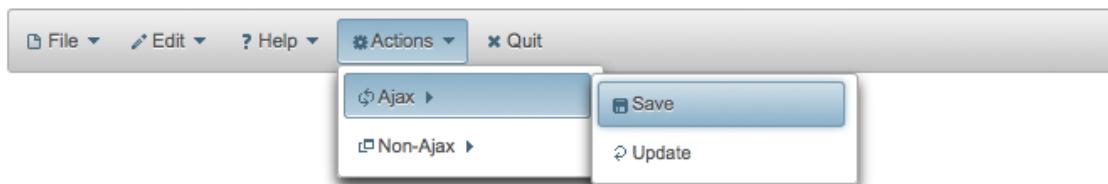

Menu resides in a main container element which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-menu	Container element of menu
.ui-menu-list	List container
.ui-menuitem	Each menu item
.ui-menuitem-link	Anchor element in a link item
.ui-menuitem-text	Text element in an item
.ui-menu-sliding	Container of ipod like sliding menu

As skinning style classes are global, see the main theming section for more information.

3.82 Menubar

Menubar is a horizontal navigation component.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

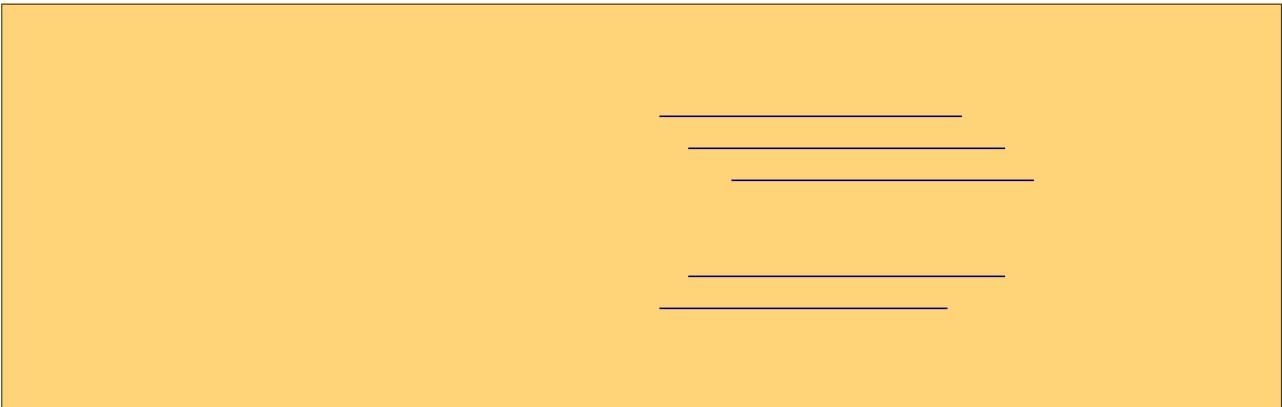

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
widgetVar	null	String	Name of the client side widget
model	null	MenuModel	MenuModel instance to create menus programmatically
style	null	String	Inline style of menubar
styleClass	null	String	Style class of menubar
autoDisplay	false	Boolean	Defines whether the first level of submenus will be displayed on mouseover or not. When set to false, click event is required to display.
tabindex	0	String	Position of the element in the tabbing order.

toggleEvent	hover	String	Event to toggle the submenus, valid values are "hover" and "click".

Getting started with Menubar

Submenus and menuitems as child components are required to compose the menubar.

Nested Menus

To create a menubar with a higher depth, nest submenus in parent submenus.

Root MenuItem

Menubar supports menuitem as root menu options as well;

Ajax and Non-Ajax Actions

As menu uses menuitems, it is easy to invoke actions with or without ajax as well as navigation. See menuitem documentation for more information about the capabilities.

Dynamic Menus

Menus can be created programmatically as well, see the dynamic menus part in menu component section for more information and an example.

Skinning

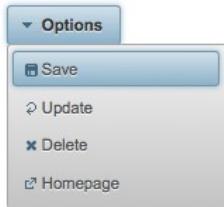

Menubar resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-menubar	Container element of menubar.
.ui-menu-list	List container
.ui-menuitem	Each menu item
.ui-menuitem-link	Anchor element in a link item
.ui-menuitem-text	Text element in an item

As skinning style classes are global, see the main theming section for more information.

3.83 MenuButton

MenuButton displays different commands in a popup menu.

value	null	String	Label of the button
style	null	String	Style of the main container element
styleClass	null	String	Style class of the main container element
widgetVar	null	String	Name of the client side widget
model	null	MenuModel	MenuModel instance to create menus programmatically
disabled	false	Boolean	Disables or enables the button.
icon	null	String	Icon of the menu button.
iconPos	left	String	Position of the icon, valid values are left and right.
appendTo	null	String	Appends the overlay to the element defined by search

			expression. Defaults to document body.
menuStyleClass	null	String	Style class of the overlay menu element.

Getting started with the MenuButton

MenuButton consists of one or more menuitems. Following menubutton example has three menuitems, first one is used triggers an action with ajax, second one does the similar but without ajax and third one is used for redirect purposes.

Dynamic Menus

Menus can be created programmatically as well, see the dynamic menus part in menu component section for more information and an example.

Skinning

MenuButton resides in a main container which *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-menu	Container element of menu.
.ui-menu-list	List container
.ui-menuitem	Each menu item
.ui-menuitem-link	Anchor element in a link item
.ui-menuitem-text	Text element in an item
.ui-button	Button element
.ui-button-text	Label of button

3.84 MenuItem

MenuItem is used by various menu components.

Info

Tag	
Tag Class	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
value	null	String	Label of the menuitem
actionListener	null	Method Expr	Action listener to be invoked when menuitem is clicked.
action	null	Method Expr	Action to be invoked when menuitem is clicked.
immediate	false	Boolean	When true, action of this menuitem is processed after apply request phase.
url	null	String	Url to be navigated when menuitem is clicked
target	null	String	Target type of url navigation
style	null	String	Style of the menuitem label
styleClass	null	String	StyleClass of the menuitem label
onclick	null	String	Javascript event handler for click event
async	false	Boolean	When set to true, ajax requests are not queued.
process	null	String	Components to process partially instead of whole view.
update	null	String	Components to update after ajax request.
disabled	false	Boolean	Disables the menuitem.

onstart	null	String	Javascript handler to execute before ajax request is begins.
oncomplete	null	String	Javascript handler to execute when ajax request is completed.
onsuccess	null	String	Javascript handler to execute when ajax request succeeds.
onerror	null	String	Javascript handler to execute when ajax request fails.
global	true	Boolean	Global ajax requests are listened by ajaxStatus component, setting global to false will not trigger ajaxStatus.
delay	null	String	If less than <i>delay</i> milliseconds elapses between calls to <i>request()</i> only the most recent one is sent and all other requests are discarded. If this option is not specified, or if the value of <i>delay</i> is the literal string 'none' without the quotes, no delay is used.
partialSubmit	false	Boolean	Enables serialization of values belonging to the partially processed components only.
partialSubmitFilter	null	String	Selector to use when partial submit is on, default is ":input" to select all descendant inputs of a partially processed components.
resetValues	false	Boolean	If true, local values of input components to be updated within the ajax request would be reset.
ignoreAutoUpdate	false	Boolean	If true, components which autoUpdate="true" will not be updated for this request. If not specified, or the value is false, no such indication is made.
timeout	0	Integer	Timeout for the ajax request in milliseconds.
ajax	true	Boolean	Specifies submit mode.
icon	null	String	Path of the menuitem image.
title	null	String	Advisory tooltip information.
outcome	null	String	Navigation case outcome.
includeViewParams	false	Boolean	Defines if page parameters should be in target URI.
fragment	null	String	Identifier of the target page element to scroll to.
disableClientWindow	false	Boolean	Disable appending the ClientWindow on the rendering of this element.
containerStyle	null	String	Inline style of the menuitem container.
containerStyleClass	null	String	Style class of the menuitem container.
form	null	String	Form to serialize for an ajax request. Default is the enclosing form.
escape	true	Boolean	Defines whether value would be escaped or not

rel	null	String	Defines the relationship between the current document and the linked document.

Getting started with MenuItem

MenuItem is a generic component used by the following components.

- Menu
- MenuBar
- MegaMenu
- Breadcrumb
- Dock
- Stack
- MenuButton
- SplitButton
- PanelMenu
- TabMenu
- SlideMenu
- TieredMenu

Note that some attributes of menuItem might not be supported by these menu components. Refer to the specific component documentation for more information.

Navigation vs Action

MenuItem has two use cases, directly navigating to a url with GET or doing a POST to execute an action. This is decided by url or outcome attributes, if either one is present menuItem does a GET request, if not parent form is posted with or without ajax decided by *ajax* attribute.

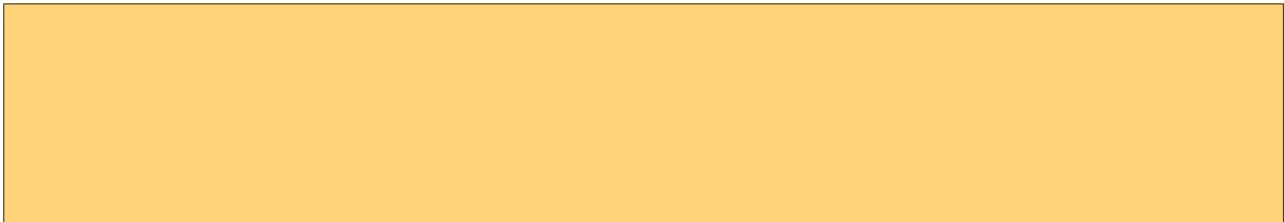

Icons

There are two ways to specify an icon of a menuItem, you can either use bundled icons within PrimeFaces or provide your own via css.

ThemeRoller Icons

Custom Icons

3.85 Message

Message is a pre-skinned extended version of the standard JSF message component.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
showSummary	false	Boolean	Specifies if the summary of the FacesMessage should be displayed.
showDetail	true	Boolean	Specifies if the detail of the FacesMessage should be displayed.
for	null	String	Id of the component whose messages to display.
redisplay	true	Boolean	Defines if already rendered messages should be displayed
display	both	String	Defines the display mode.
escape	true	Boolean	Defines whether html would be escaped or not.
severity	null	String	Comma separated list of severities to display only.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.

Getting started with Message

Message usage is exactly same as standard message.

Display Mode

Message component has three different display modes;

- text : Only message text is displayed.
- icon : Only message severity is displayed and message text is visible as a tooltip.
- both (default) : Both icon and text are displayed.

Severity Levels

Using severity attribute, you can define which severities can be displayed by the component. For instance, you can configure messages to only display infos and warnings.

Escaping

Component escapes html content in messages by default, in case you need to display html, disable escape option.

Skinning

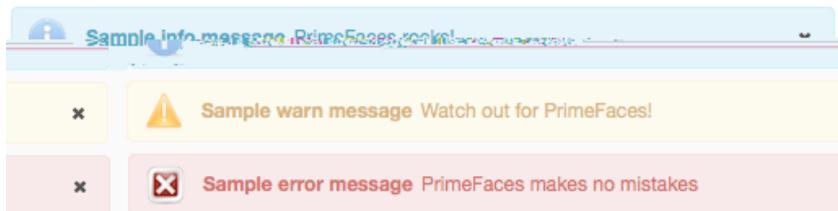

Full list of CSS selectors of message is as follows;

ui-message-{severity}	Container element of the message
ui-message-{severity}-summary	Summary text
ui-message-{severity}-detail	Detail text

{severity} can be 'info', 'error', 'warn' and error.

3.86 Messages

Messages is a pre-skinned extended version of the standard JSF messages component.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
showSummary	true	Boolean	Specifies if the summary of the FacesMessages should be displayed.
showDetail	false	Boolean	Specifies if the detail of the FacesMessages should be displayed.
globalOnly	false	String	When true, only facesmessages with no clientIds are displayed.
redisplay	true	Boolean	Defines if already rendered messages should be displayed
autoUpdate	false	Boolean	Enables auto update mode if set true.
for	null	String	Name of associated key, takes precedence when used with globalOnly.
escape	true	Boolean	Defines whether html would be escaped or not.

severity	null	String	Comma separated list of severities to display only.
closable	false	Boolean	Adds a close icon to hide the messages.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
showIcon	true	Boolean	Defines if severity icons would be displayed.

Getting started with Messages

Message usage is exactly same as standard messages.

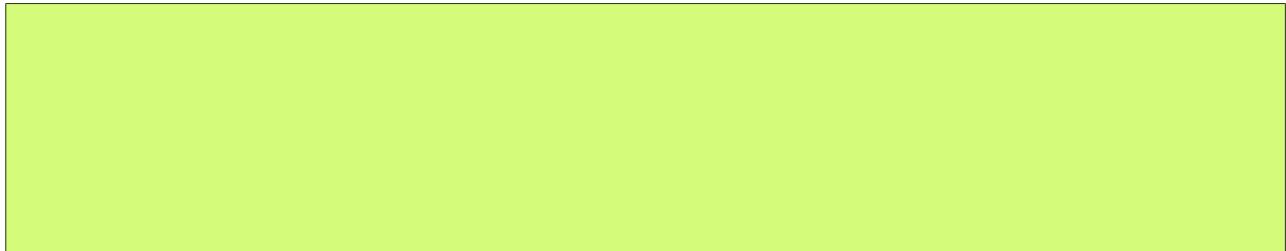

AutoUpdate

When auto update is enabled, messages component is updated with each ajax request automatically.

Targetable Messages

There may be times where you need to target one or more messages to a specific message component, for example suppose you have growl and messages on same page and you need to display some messages on growl and some on messages. Use for attribute to associate messages with specific components.

In sample above, messages will display first and second message and growl will only display the 3rd message.

Severity Levels

Using severity attribute, you can define which severities can be displayed by the component. For instance, you can configure messages to only display infos and warnings.

Escaping

Messages escapes html content in messages, disable escape option to display content as html.

Skinning

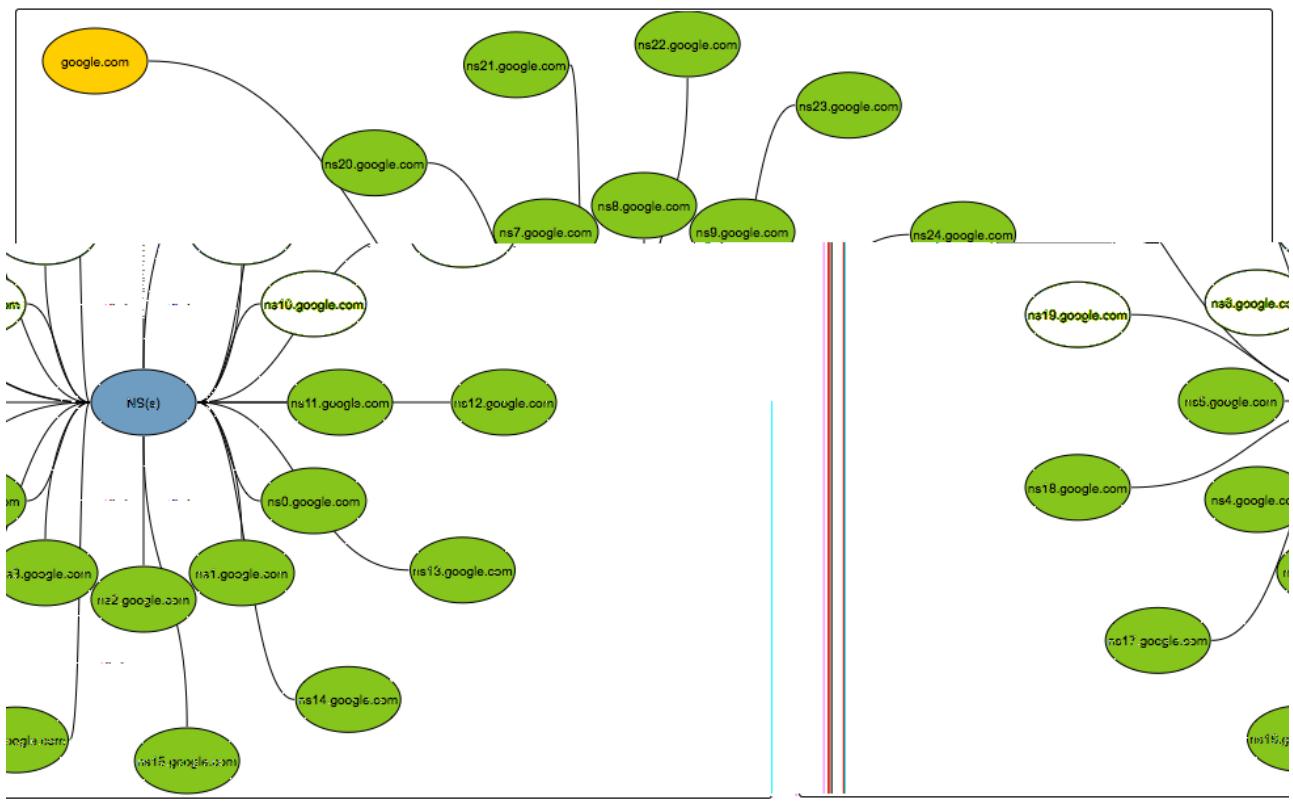

Full list of CSS selectors of message is as follows;

ui-messages-{severity}	Container element of the message
ui-messages-{severity}-summary	Summary text
ui-messages-{severity}-detail	Detail text
ui-messages-{severity}-icon	Icon of the message.

{severity} can be 'info', 'error', 'warn' and error.

3.87 Mindmap

Mindmap is an interactive tool to visualize mindmap data featuring lazy loading, callbacks, animations and more.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

<code>id</code>	<code>null</code>	<code>String</code>	Unique identifier of the component
<code>rendered</code>	<code>true</code>	<code>Boolean</code>	Boolean value to specify the rendering of the component, when set to false component will not be rendered.

binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	MindmapNode	MenuModel instance to build menu dynamically.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
effectSpeed	300	Integer	Speed of the animations in milliseconds.
widgetVar	null	String	Name of the client side widget.

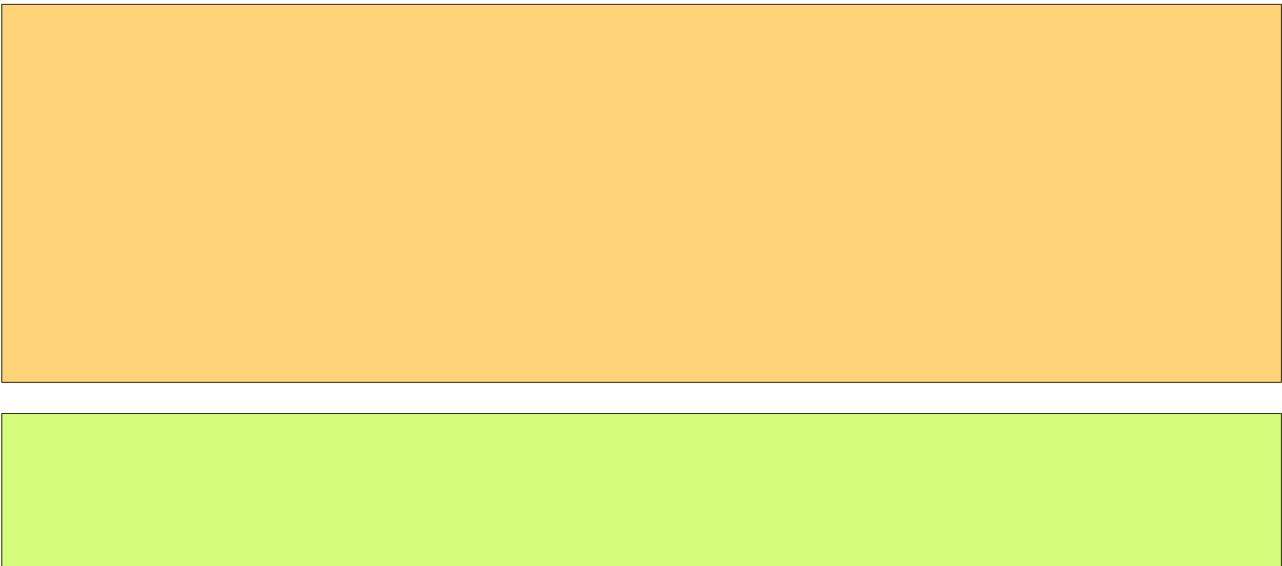

Getting started with Mindmap

Mindmap requires an instance of *org.primefaces.model.mindmap.MindmapNode* as the root. Due to it's lazy nature, a select ajax behavior must be provided to load children of selected node on the fly with ajax.

DoubleClick Behavior

Selecting a node with single click is used to load subnodes, double click behavior is also provided for further customization. Following sample, displays the details of the subnode in a dialog.

MindmapNode API

org.primefaces.model.mindmap.MindmapNode

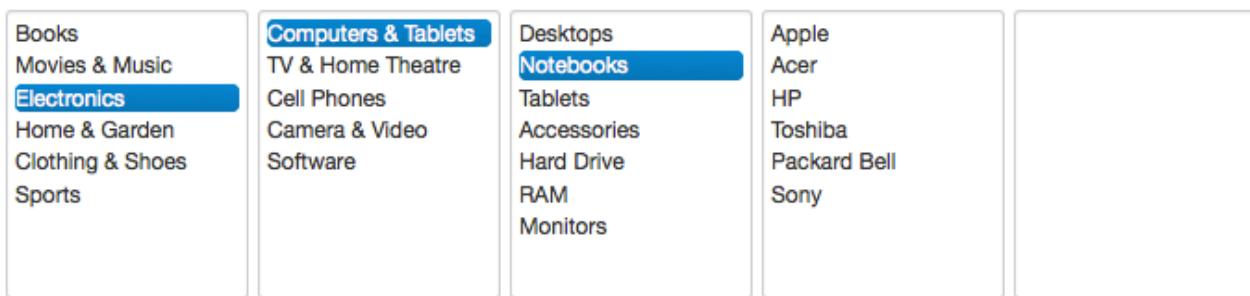

label	null	String	Label of the node.
data	null	Object	Optional data associated with the node.
fill	null	String	Color code of the node.
selectable	1	Boolean	Flag to define if node is clickable.
parent	null	MindmapNode	Parent node instance.

Tips

- IE 7 and IE 8 are not supported due to technical limitations, IE 9 is supported.

3.88 MultiSelectListbox

MultiSelectListbox is used to select an item from a collection of listboxes that are in parent-child relationship.

Info

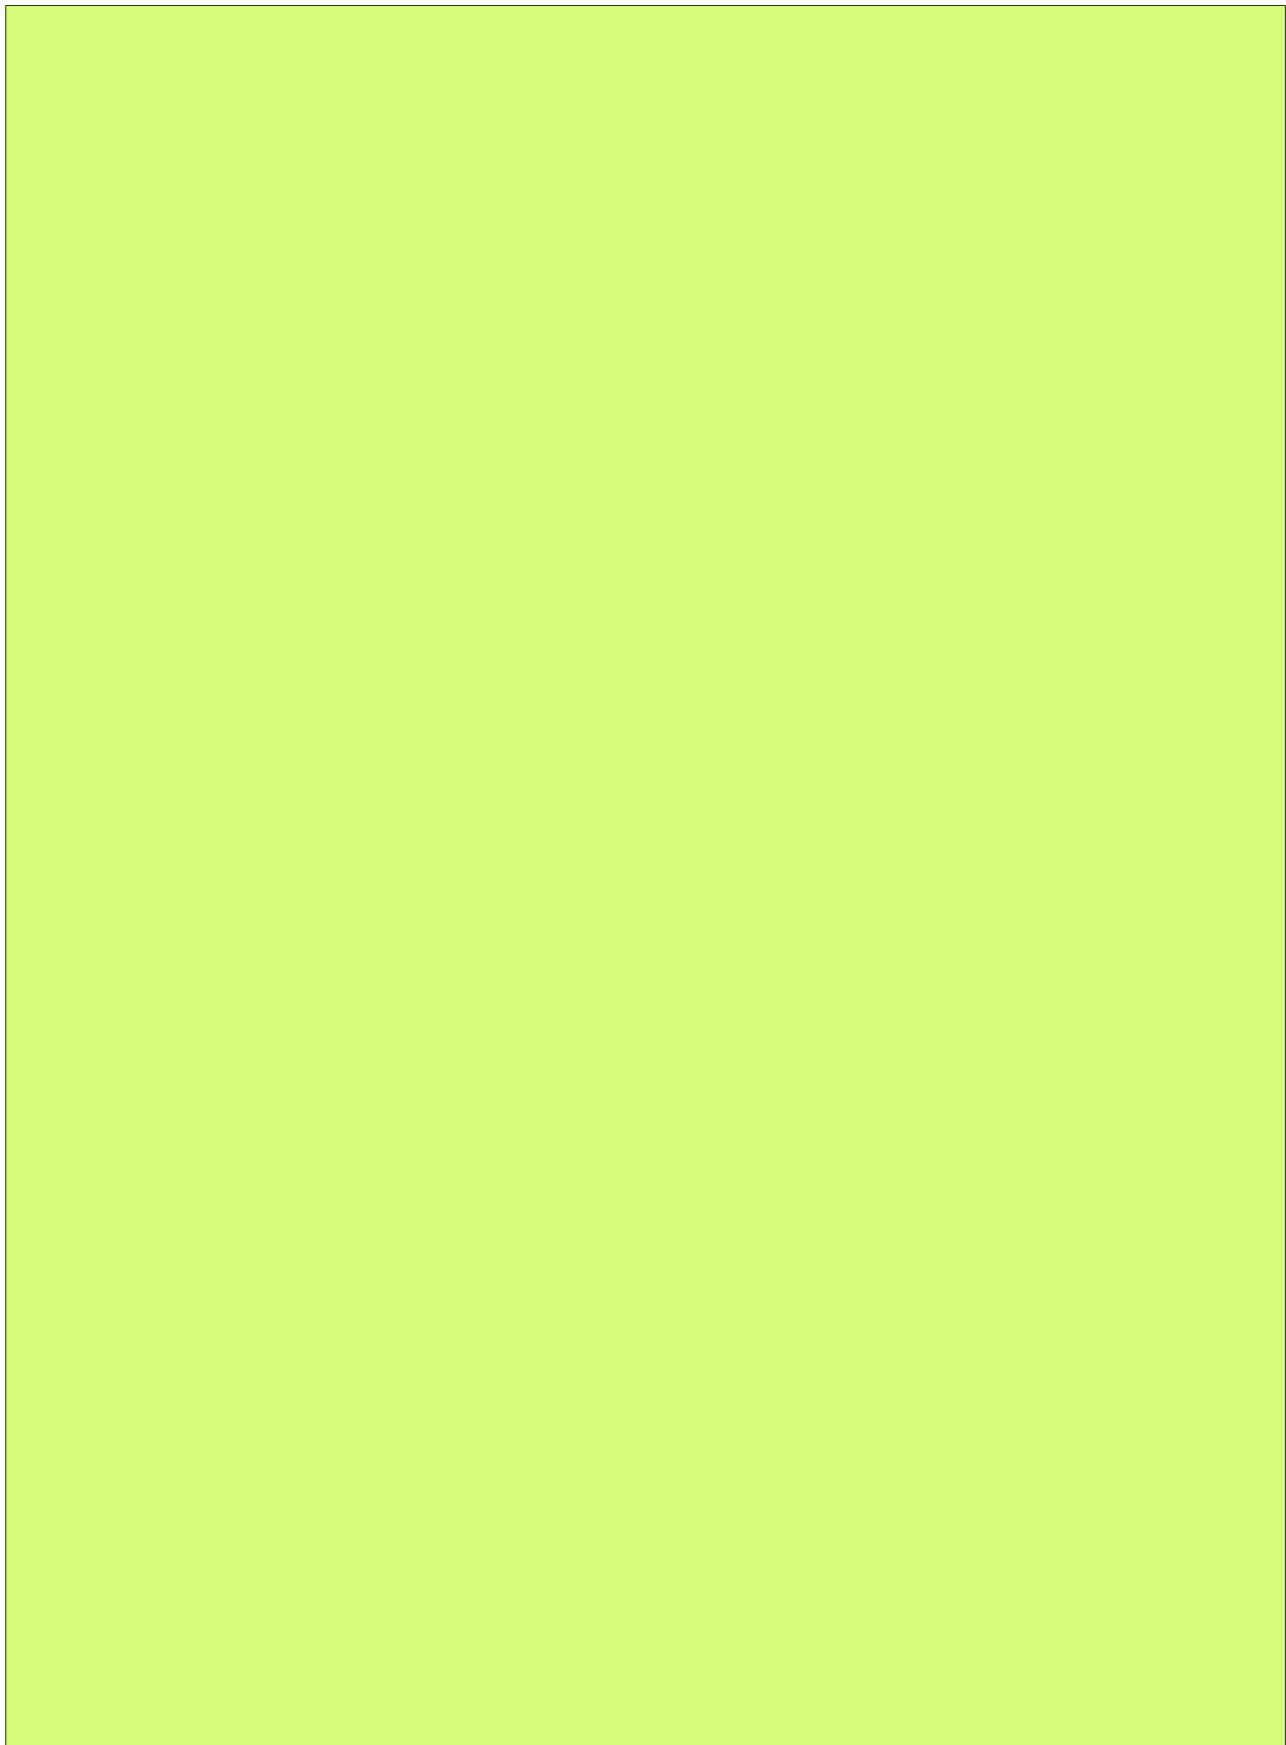

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
widgetVar	null	String	Name of the client side widget.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
disabled	false	Boolean	If true, disables the component.
effect	null	String	Effect to use when showing a group of items.
showHeaders	false	Boolean	Displays label of a group at header section of the children items.
header	null	String	Label of the root group items.

Getting started with MultiSelectListbox

MultiSelectListbox needs a collection of SelectItemGroups.

Note that SelectItemGroups are not selectable, only values of SelectItems can be passed to the bean.

Effects

An animation is executed during toggling of a group, following options are available for *effect* attribute; blind, bounce, clip, drop, explode, fold, highlight, puff, pulsate, scale, shake, size, slide (suggested).

Client Side API

Widget: *PrimeFaces.widget.MultiSelectListbox*

enable()	-	void	Enables the component.
disable()	-	void	Disables the component.
showItemGroup(item)	li element as jQuery object	void	Shows subcategories of a given item.

Skinning

MultiSelectListbox resides in a main container which *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-multiselectlistbox	Main container element.
.ui-multiselectlistbox-list	List container.
.ui-multiselectlistbox-item	Each item in a list.

3.89 NotificationBar

NotificationBar displays a multipurpose fixed positioned panel for notification.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
style	null	String	Style of the container element
styleClass	null	String	StyleClass of the container element
position	top	String	Position of the bar, "top" or "bottom".
effect	fade	String	Name of the effect, "fade", "slide" or "none".
effectSpeed	normal	String	Speed of the effect, "slow", "normal" or "fast".
autoDisplay	false	Boolean	When true, panel is displayed on page load.
widgetVar	null	String	Name of the client side widget.

Getting started with NotificationBar

As notificationBar is a panel component, any content can be placed inside.

Showing and Hiding

To show and hide the content, notificationBar provides an easy to use client side api that can be accessed through the widgetVar. `show()` displays the bar and `hide()` hides it. `isVisible()` and `toggle()` are additional client side api methods.

Note that notificationBar has a default built-in close icon to hide the content.

Effects

Default effect to be used when displaying and hiding the bar is "fade", another possible effect is "slide".

If you'd like to turn off animation, set effect name to "none". In addition duration of the animation is controlled via effectSpeed attribute that can take "normal", "slow" or "fast" as it's value.

Position

Default position of bar is "top", other possibility is placing the bar at the bottom of the page. Note that bar positioning is fixed so even page is scrolled, bar will not scroll.

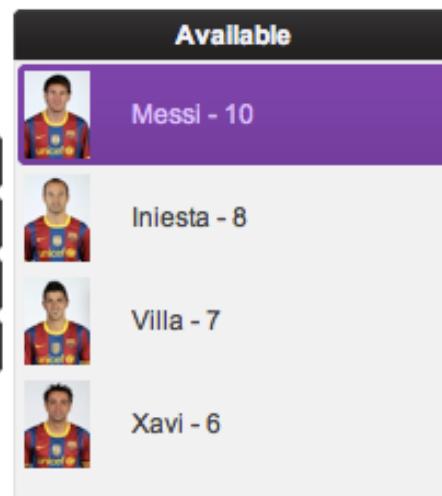

Skinning

`style` and `styleClass` attributes apply to the main container element. Additionally there are two pre-defined css selectors used to customize the look and feel.

.ui-notificationbar	Main container element

3.90 OrderList

OrderList is used to sort a collection featuring drag&drop based reordering, transition effects and pojo support.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	True	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component referring to a List.
converter	null	Converter /String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id

immediate	0	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	0	Boolean	Marks component as required
validator	null	Method Expr	A method expression that refers to a method validationg the input
valueChangeListener	null	Method Expr	A method expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
var	null	String	Name of the iterator.
itemLabel	null	String	Label of an item.
itemValue	null	String	Value of an item.
style	null	String	Inline style of container element.
styleClass	null	String	Style class of container element.
disabled	0	Boolean	Disables the component.
effect	fade	String	Name of animation to display.
moveUpLabel	Move Up	String	Label of move up button.
moveTopLabel	Move Top	String	Label of move top button.
moveDownLabel	Move Down	String	Label of move down button.
moveBottomLabel	Move Bottom	String	Label of move bottom button.
controlsLocation	left	String	Location of the reorder buttons, valid values are "left", "right" and "none".
responsive	false	Boolean	In responsive mode, orderList adjusts itself based on screen width.

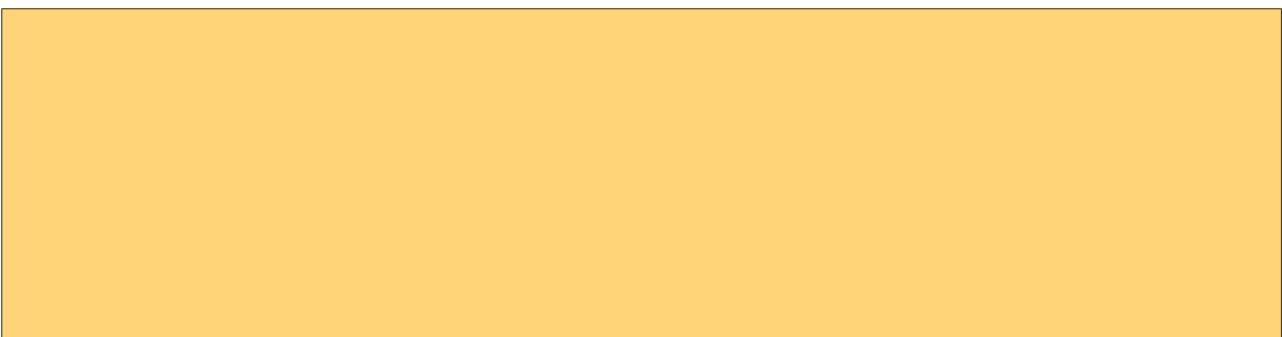

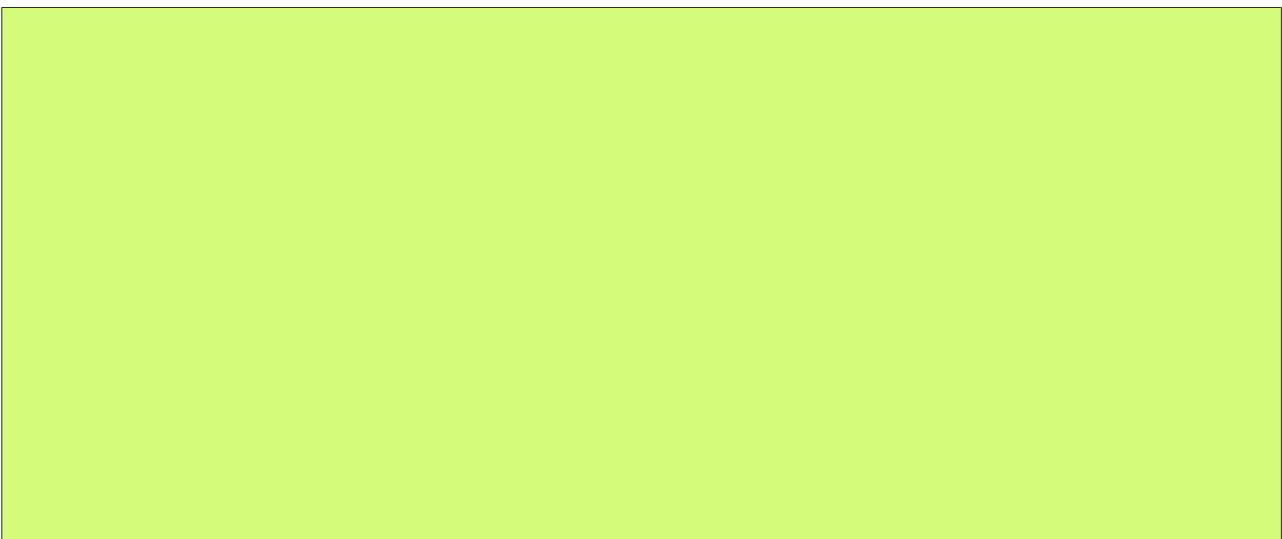

Getting started with OrderList

A list is required to use OrderList component.

Advanced OrderList

OrderList supports displaying custom content instead of simple labels by using columns. In addition, pojos are supported if a converter is defined.

Ajax Behavior Events

select	org.primefaces.event.SelectEvent	When an item selected.
unselect	org.primefaces.event.UnselectEvent	When an item unselected.
reorder	javax.faces.event.AjaxBehaviorEvent	When list is reordered.

Header

A facet called “caption” is provided to display a header content for the orderlist.

Effects

An animation is executed during reordering, default effect is fade and following options are available for *effect* attribute; blind, bounce, clip, drop, explode, fold, highlight, puff, pulsate, scale, shake, size and slide.

Skinning

OrderList resides in a main container which *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-orderlist	Main container element.
.ui-orderlist-list	Container of items.
.ui-orderlist-item	Each item in the list.
.ui-orderlist-caption	Caption of the list.

3.91 Organigram

Organigram is a data component to display an organizational hierarchy.

Info

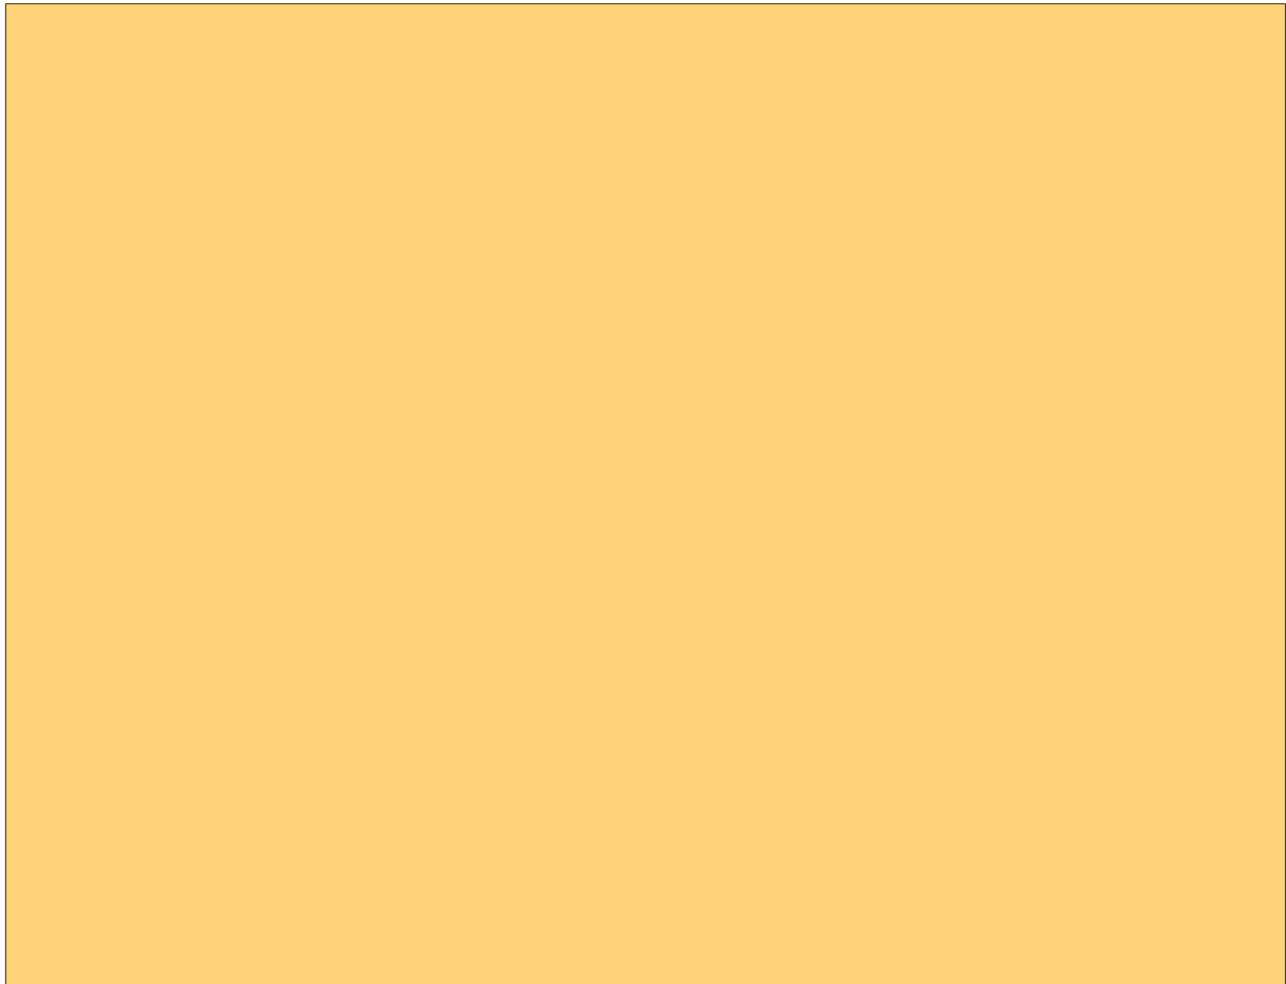

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Organigram Node	Model instance.
var	null	String	Name of the request-scoped variable that'll be used to refer each treenode data during rendering.
selection	null	Organigram Node	OrganigramNode to reference the selection.
LeafNodeConnectorHeight	10	Integer	The height of the connector line for leaf nodes.
zoom	false	Boolean	Defines if zoom controls are rendered.
autoScrollToSelection	false	Boolean	Auto scroll to the selected node on rendering if enabled.
style	null	String	Style of the main container element of organigram.
styleClass	null	String	Style class of the main container element of organigram.
widgetVar	null	String	Name of the client side widget.

Getting Started with Organigram

Organigram requires an instance of `OrganigramNode` interface as its value to define the root, a default implementation `DefaultOrganigramNode` is provided. Each node has a type where each node at the backend needs to match the `p:organigramNode` helper component.

Ajax Behavior Events

OrU¶4\$HD2{Ag."oLV{U□X.*U

3.92 OrganigramNode

Represents a node in an Organigram model.

Info

Tag

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
type	default	String	Type of the node to match in model.
icon	null	String	The icon to be displayed
iconPos	null	Organigram Node	The icon position. Empty, "right" or "left".
expandedIcon	null	String	Icon of the expanded state.
collapsedIcon	null	String	Icon of the collapsed state.
skipLeafHandling	false	Boolean	If the leaf handling should be skipped.
style	null	String	Inline style of the element.
styleClass	null	String	Style class of the element.

Getting Started with OrganigramNode

Refer to Organigram for details.

3.93 OutputLabel

OutputLabel is a an extension to the standard outputLabel component.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	String	Label to display.
accesskey	null	String	The accesskey attribute is a standard HTML attribute that sets the access key that transfers focus to this element when pressed.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
escape	true	Boolean	Defines if value should be escaped or not.
for	null	String	Component to attach the label to.

tabindex	null	String	Position in tabbing order.
title	null	String	Advisory tooltip information.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
onblur	null	String	Client side callback to execute when component loses focus.
onclick	null	String	Client side callback to execute when component is clicked.
ondblclick	null	String	Client side callback to execute when component is double clicked.
onfocus	null	String	Client side callback to execute when component receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over component.
onkeypress	null	String	Client side callback to execute when a key is pressed and released over component.
onkeyup	null	String	Client side callback to execute when a key is released over component.
onmousedown	null	String	Client side callback to execute when a pointer is pressed down over component.
onmouseout	null	String	Client side callback to execute when a pointer is moved away from component.
onmouseover	null	String	Client side callback to execute when a pointer is moved onto component.
onmouseup	null	String	Client side callback to execute when a pointer is released over component.
indicateRequired	true	Boolean	Displays * symbol if the input is required.

Getting Started with OutputLabel

Usage is same as standard outputLabel, an input component is associated with for attribute.

Auto Label

OutputLabel sets its value as the label of the target component to be displayed in validation errors so the target component does not need to define the label attribute again.

can be rewritten as;

Support for Advanced Components

Some PrimeFaces input components like spinner, autocomplete does not render just basic inputs so standard outputLabel component cannot apply focus to these, however PrimeFaces outputLabel can.

Validations

When the target input is required, outputLabel displays * symbol next to the value. In case any validation fails on target input, label will also be displayed with theme aware error styles.

Skinning

Label renders a label element that *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-outputlabel	Label element
.ui-state-error	Label element when input is invalid
.ui-outputlabel-rfi	Required field indicator.

3.94 OutputPanel

OutputPanel is a panel component with the ability to auto update.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

PlaceHolder

When a JSF component is not rendered, no markup is rendered so for components with conditional rendering, regular update mechanism may not work since the markup to update on page does not exist. OutputPanel is useful in this case to be used as a placeholder.

Suppose the rendered condition on bean is false when page is loaded initially and search method on bean sets the condition to be true meaning datatable will be rendered after a page submit. The problem is although partial output is generated, the markup on page cannot be updated since it doesn't exist.

Solution is to use the outputPanel as a placeHolder.

Note that you won't need an outputPanel if commandButton has no update attribute specified, in this case parent form will be updated partially implicitly making an outputPanel use obsolete.

Deferred Loading

When this feature option is enabled, content of panel is not loaded along with the page but loaded after the page on demand. Initially panel displays a loading animation after page load to indicate more content is coming up and displays content with ajax update. Using *deferredMode* option, it is possible to load contents not just after page load (default mode) but when it becomes visible on page scroll as well. This feature is very useful to increase page load performance, assume you have one part of the page that has components dealing with backend and taking time, with deferred mode on, rest of the page is loaded instantly and time taking process is loaded afterwards with ajax.

Layout

OutputPanel has two layout modes;

- block (default): Renders a div
- inline: Renders a span

AutoUpdate

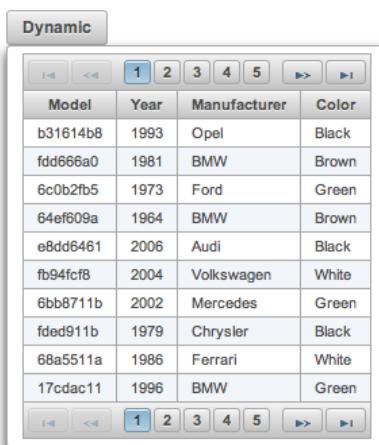

When auto update is enabled, outputPanel component is updated with each ajax request automatically.

Skinning

style and *styleClass* attributes are used to style the outputPanel, by default *.ui-outputpanel* css class is added to element and *.ui-outputpanel-loading* when content is loading in deferred loading case.

3.95 OverlayPanel

OverlayPanel is a generic panel component that can be displayed on top of other content.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

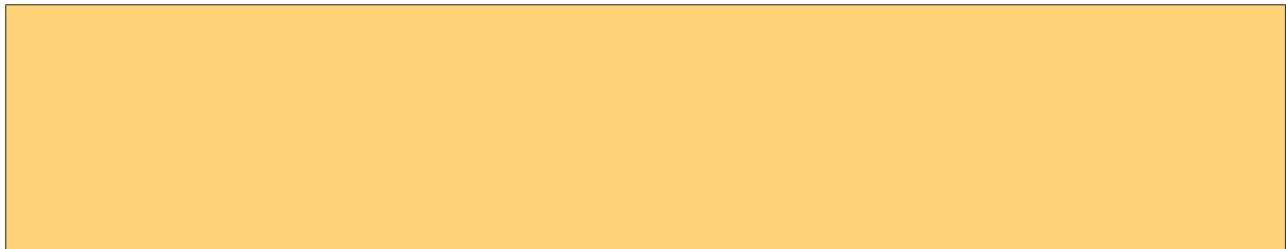

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
style	null	String	Inline style of the panel.
styleClass	null	String	Style class of the panel.
for	null	String	Target component to display panel next to.
showEvent	click	String	Event on target to show the panel.

hideEvent	click	String	Event on target to hide the panel.
showEffect	null	String	Animation to display when showing the panel.
hideEffect	null	String	Animation to display when hiding the panel.
appendToBody	0	Boolean	When true, panel is appended to document body.
onShow	null	String	Client side callback to execute when panel is shown.
onHide	null	String	Client side callback to execute when panel is hidden.
my	left top	String	Position of the panel relative to the target.
at	left bottom	String	Position of the target relative to the panel.
dynamic	false	Boolean	Defines content loading mode.
dismissible	true	Boolean	When set true, clicking outside of the panel hides the overlay.
showCloseIcon	false	Boolean	Displays a close icon to hide the overlay, default is false.
modal	false	Boolean	Boolean value that specifies whether the document should be shielded with a partially transparent mask to require the user to close the Panel before being able to activate any elements in the document.

Getting started with OverlayPanel

OverlayPanel needs a component as a target in addition to the content to display. Example below demonstrates an overlayPanel attached to a button to show a chart in a popup.

Events

Default event on target to show and hide the panel is mousedown. These are customized using *showEvent* and *hideEvent* options.

Effects

blind, bounce, clip, drop, explode, fold, highlight, puff, pulsate, scale, shake, size, slide are available values for *showEffect* and *hideEffect* options if you'd like display animations.

Positioning

By default, left top corner of panel is aligned to left bottom corner of the target if there is enough space in window viewport, if not the position is flipped on the fly to find the best location to display. In order to customize the position use *my* and *at* options that takes combinations of left, right, bottom and top e.g. "right bottom".

Dynamic Mode

Dynamic mode enables lazy loading of the content, in this mode content of the panel is not rendered on page load and loaded just before panel is shown. Also content is cached so consecutive displays do not load the content again. This feature is useful to reduce the page size and reduce page load time.

Standalone

OverlayPanel is positioned relative to its target based on a one-to-one relationship, this causes limitations when used inside a data iteration because every row needs an overlaypanel which is far from ideal, requires client side memory and slows down page performance. Instead a single overlayPanel can be used by calling show passing the client id of the component to be relatively positioned. See [overlayPanel demo](#) in showcase for an example.

Skinning

Panel resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-overlaypanel	Main container element of panel

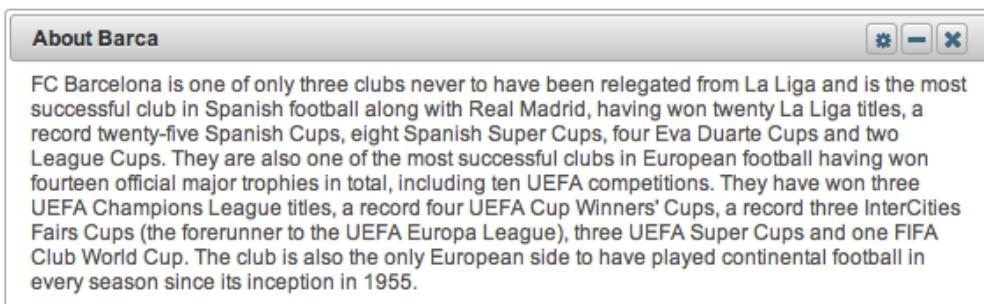

As skinning style classes are global, see the main theming section for more information.

Tips

- Enable *appendToBody* when overlayPanel is in other panel components like layout, dialog ...
- If there is a component with a popup like calendar, autocomplete placed inside the overlay panel, popup part might exceed the boundaries of panel and clicking the outside hides the panel. This is undesirable so in cases like this use overlayPanel with *dismissible* false and optional *showCloseIcon* settings.

3.96 Panel

Panel is a grouping component with content toggle, close and menu integration.

toggleOrientation	vertical	String	Defines the orientation of the toggling, valid values are vertical and horizontal.
widgetVar	null	String	Name of the client side widget

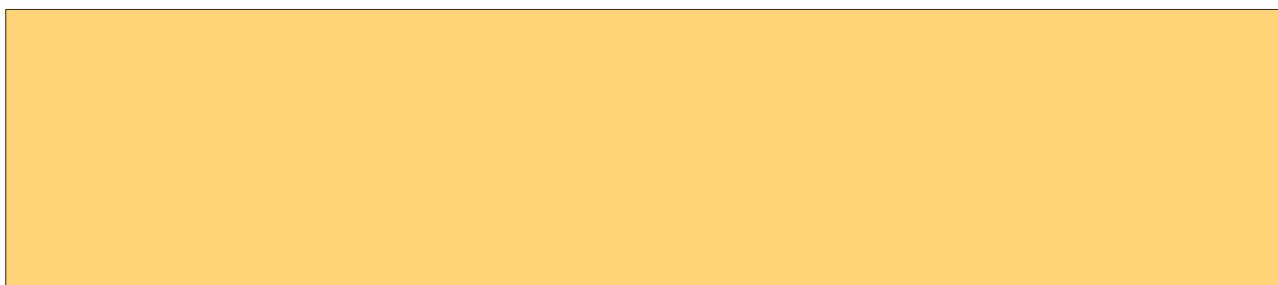

Getting started with Panel

Panel encapsulates other components.

Header and Footer

Header and Footer texts can be provided by *header* and *footer* attributes or the corresponding facets. When same attribute and facet name are used, facet will be used.

Ajax Behavior Events

Panel provides custom ajax behavior events for toggling and closing features.

toggle	org.primefaces.event.ToggleEvent	When panel is expanded or collapsed.
close	org.primefaces.event.CloseEvent	When panel is closed.

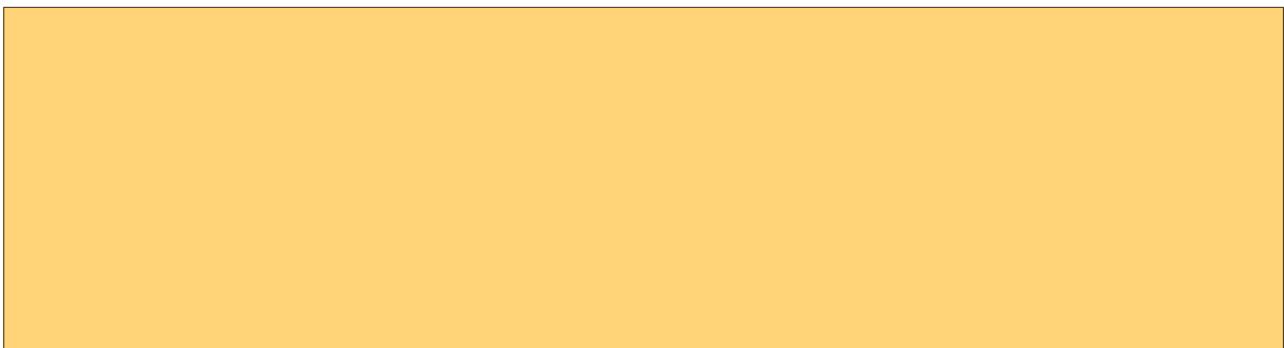

Popup Menu

Panel has built-in support to display a fully customizable popup menu, an icon to display the menu is placed at top-right corner. This feature is enabled by defining a menu component and defining it as the options facet.

Custom Action

If you'd like to add custom actions to panel titlebar, use actions facet with icon markup;

Skinning Panel

Panel resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-panel	Main container element of panel
.ui-panel-titlebar	Header container
.ui-panel-title	Header text
.ui-panel-titlebar-icon	Option icon in header
.ui-panel-content	Panel content
.ui-panel-footer	Panel footer

As skinning style classes are global, see the main theming section for more information.

3.97 PanelGrid

PanelGrid is an extension to the standard panelGrid component with additional features such as theming and colspan-rowspan.

1995-96 NBA Playoffs						
Conf. Semifinals		Conf. Finals		NBA Finals		Champion
Seattle	4		Seattle	4		
Houston	0				Seattle	2

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

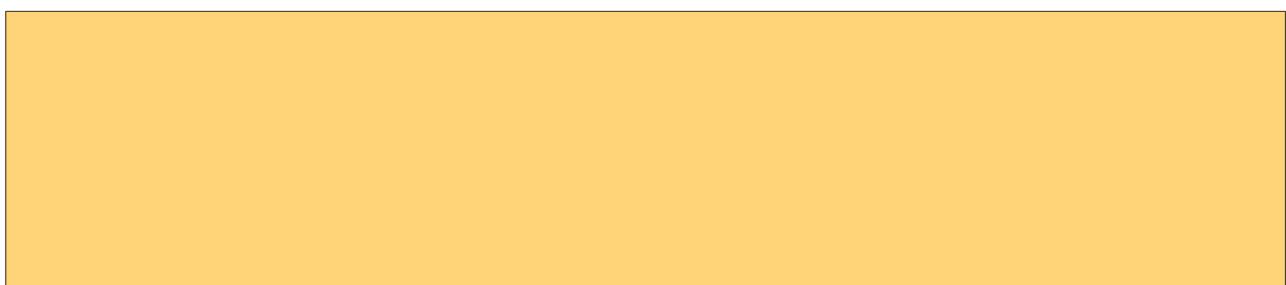

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
columns	false	Integer	Number of columns in grid.

style	null	String	Inline style of the panel.
styleClass	null	String	Style class of the panel.
columnClasses	null	String	Comma separated list of column style classes.
layout	tabular	String	Displays data in a 'table' layout or 'grid' layout. The grid layout is a responsive layout.
role	grid	String	Role for aria.

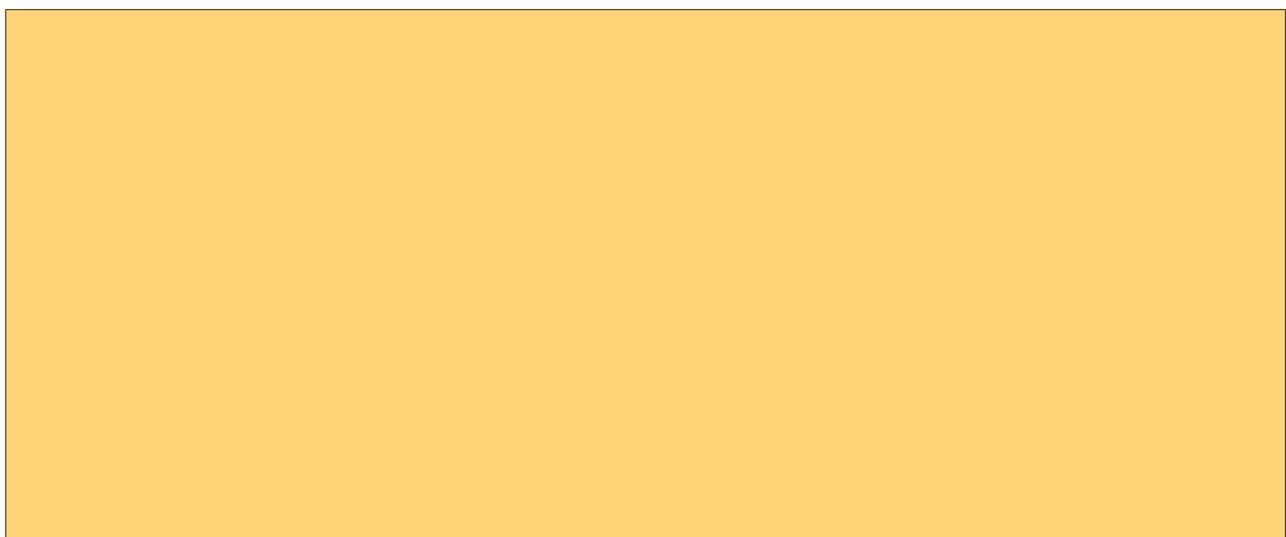

Getting started with PanelGrid

Basic usage of panelGrid is same as the standard one.

Header and Footer

PanelGrid provides facets for header and footer content.

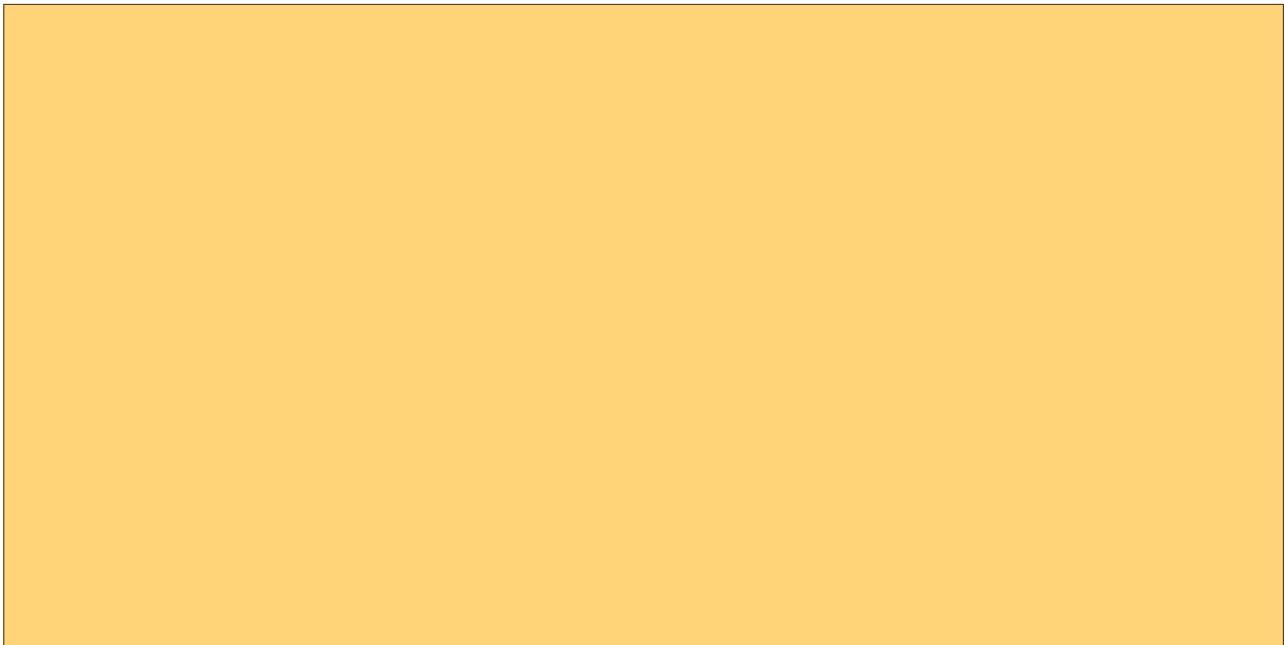

Basic PanelGrid

Firstname: *	<input type="text"/>
Surname: *	<input type="text"/>
<input checked="" type="button" value="Save"/>	

Rowspan and Colspan

PanelGrid supports rowspan and colspan options as well, in this case row and column markup should be defined manually.

* Note that this approach does not support grid layout.

Blank Mode

To remove borders add ui-noborder style class to the component using styleClass attribute and to remove borders plus background color, apply ui-panelgrid-blank style.

Skinning

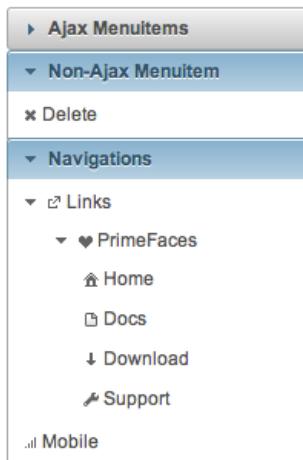

PanelGrid resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-panelgrid	Main container element of panelGrid.
.ui-panelgrid-header	Header.
.ui-panelgrid-footer	Footer.
.ui-panelgrid-even	Even numbered rows.
.ui-panelgrid-odd	Odd numbered rows.

As skinning style classes are global, see the main theming section for more information.

3.98 PanelMenu

PanelMenu is a hybrid component of accordionPanel and tree components.

Info

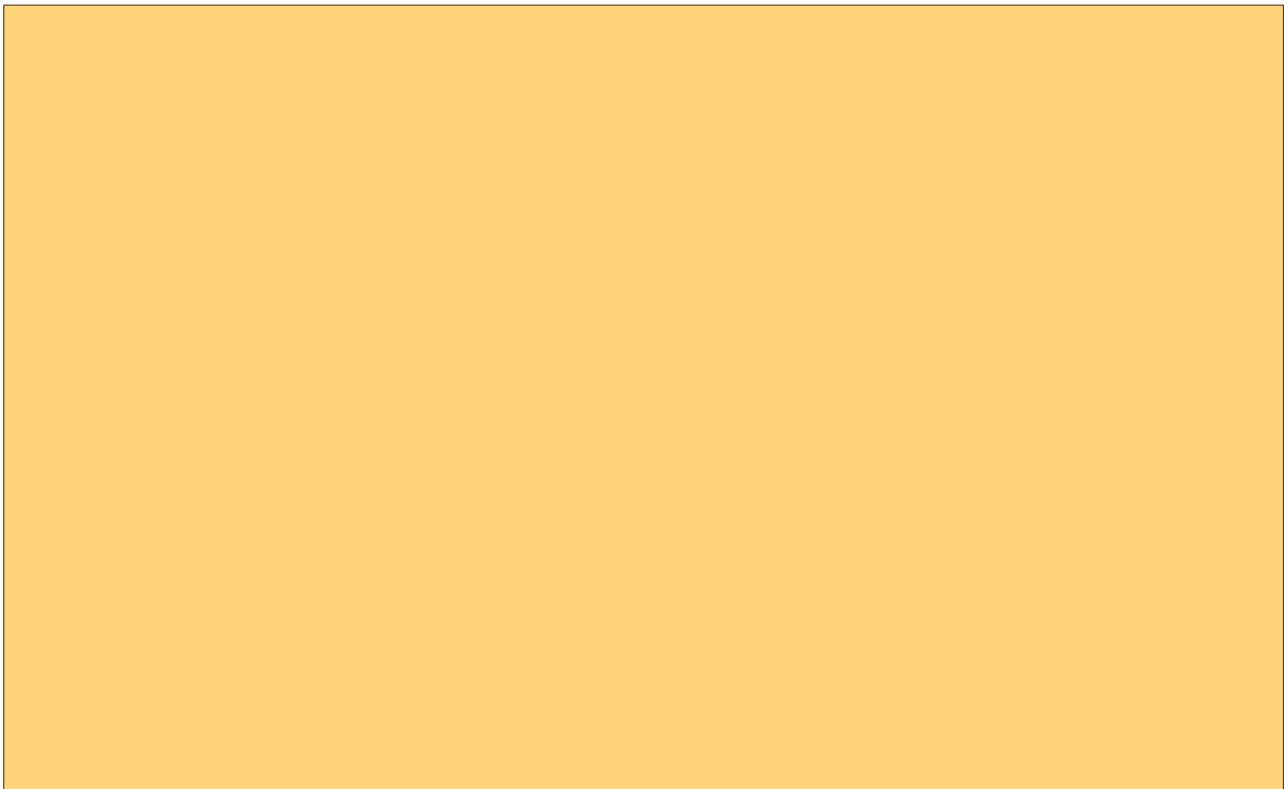

Tag

Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
model	null	MenuModel	MenuModel instance to build menu dynamically.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
widgetVar	null	String	Name of the client side widget.
stateful	true	Boolean	Menu state is saved in a cookie

Getting started with PanelMenu

PanelMenu consists of submenus and menuitems. First level of submenus are rendered as accordion panels and descendant submenus are rendered as tree nodes. Just like in any other menu component, menuitems can be utilized to do ajax requests, non-ajax requests and simple GET navigations.

Default State

By default, all submenus are collapsed, set expanded on a submenu to true to initially display a submenu as expanded.

Skinning

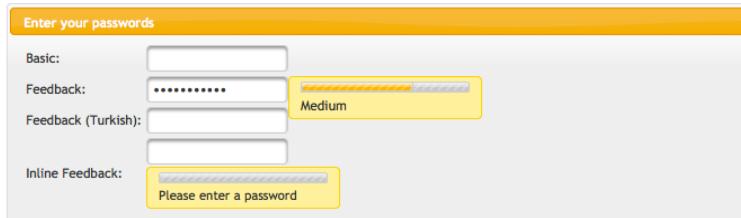

PanelMenu resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-panelmenu	Main container element.
.ui-panelmenu-header	Header of a panel.
.ui-panelmenu-content	Footer of a panel.
.ui-panelmenu .ui-menu-list	Tree container.
.ui-panelmenu .ui-menuitem	A menuitem in tree.

As skinning style classes are global, see the main theming section for more information.

3.99 Password

Password component is an extended version of standard inputSecret component with theme integration and strength indicator.

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component than can be either an EL expression of a literal text
converter	null	Converter /String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	boolean	Marks component as required
validator	null	Method Expr	A method expression that refers to a method validationg the input.

valueChangeListener	null	Method Expr	A method binding expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
feedback	false	Boolean	Enables strength indicator.
inline	false	boolean	Displays feedback inline rather than using a popup.
promptLabel	Please enter a password	String	Label of prompt.
weakLabel	Weak	String	Label of weak password.
goodLabel	Good	String	Label of good password.
strongLabel	Strong	String	Label of strong password.
redisplay	false	Boolean	Whether or not to display previous value.
match	null	String	Id of another password component to match value against.
widgetVar	null	String	Name of the client side widget.
accesskey	null	String	Access key that when pressed transfers focus to the input element.
alt	null	String	Alternate textual description of the input field.
autocomplete	null	String	Controls browser autocomplete behavior.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
disabled	false	Boolean	Disables input field
label	null	String	A localized user presentable name.
lang	null	String	Code describing the language used in the generated markup for this component.
maxlength	null	Integer	Maximum number of characters that may be entered in this field.
onblur	null	String	Client side callback to execute when input element loses focus.
onchange	null	String	Client side callback to execute when input element loses focus and its value has been modified since gaining focus.
onclick	null	String	Client side callback to execute when input element is clicked.

ondblclick	null	String	Client side callback to execute when input element is double clicked.
onfocus	null	String	Client side callback to execute when input element receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over input element.
onkeypress	null	String	Client side callback to execute when a key is pressed and released over input element.
onkeyup	null	String	Client side callback to execute when a key is released over input element.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over input element
onmousemove	null	String	Client side callback to execute when a pointer button is moved within input element.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from input element.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto input element.
onmouseup	null	String	Client side callback to execute when a pointer button is released over input element.
onselect	null	String	Client side callback to execute when text within input element is selected by user.
placeholder	null	String	Specifies a short hint.
readonly	false	Boolean	Flag indicating that this component will prevent changes by the user.
size	null	Integer	Number of characters used to determine the width of the input element.
style	null	String	Inline style of the input element.
styleClass	null	String	Style class of the input element.
tabindex	null	Integer	Position of the input element in the tabbing order.
title	null	String	Advisory tooltip information.

Getting Started with Password

Password is an input component and used just like a standard input text. When *feedback* option is enabled a password strength indicator is displayed.

I18N

Although all labels are in English by default, you can provide custom labels as well. Following password gives feedback in Turkish.

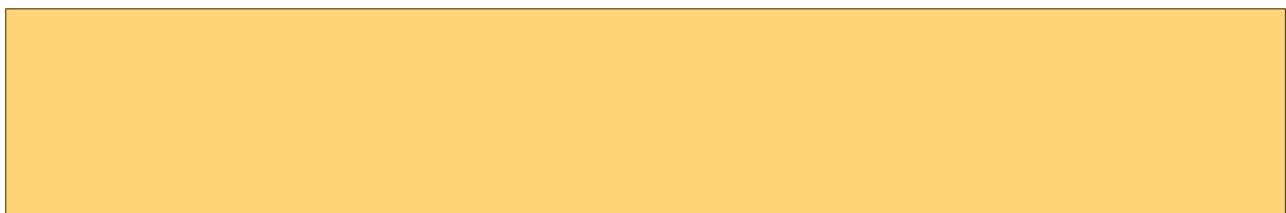

Inline Strength Indicator

By default strength indicator is shown in an overlay, if you prefer an inline indicator just enable inline mode.

Confirmation

Password confirmation is a common case and password provides an easy way to implement. The other password component's id should be used to define the *match* option.

Skinning

Structural selectors for password are;

.ui-password	Input element.
.ui-password-panel	Overlay panel of strength indicator.
.ui-password-meter	Strength meter.
.ui-password-info	Strength label.

As skinning style classes are global, see the main theming section for more information.

3.100 PhotoCam

PhotoCam is used to take photos with webcam and send them to the JSF backend model.

Attributes

id	null	String	Unique identifier of the component
rendered	false	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component than can be either an EL expression of a literal text
converter	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	0	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	0	boolean	Marks component as required
validator	null	Method Expr	A method binding expression that refers to a method validationg the input
valueChangeListener	null	Method Expr	A method binding expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.

widgetVar	null	String	Name of the client side widget.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
process	null	String	Identifiers of components to process during capture.
update	null	String	Identifiers of components to update during capture.
listener	null	Method Expr	Method expression to listen to capture events.
width	320	Integer	Width of the camera viewport.
height	240	Integer	Height of the camera viewport.
photoWidth	320	Integer	Width of the captured photo, defaults to width.
photoHeight	240	Integer	Height of the captured photo, defaults to height.
format	jpeg	Boolean	Format of the image, valid values are "jpeg" default and png.
jpegQuality	90	Integer	Quality of the image between 0 and 100 when the format is jpeg, default value is 90.
forceFlash	false	Boolean	Enables always using flash fallback even in an HTML5 environment.

Getting started with PhotoCam

Capture is triggered via client side api's *capture* method. Also a method expression is necessary to invoke when an image is captured. Sample below captures an image and saves it to a directory.

3.101 PickList

PickList is used for transferring data between two different collections.

value	null	Object	Value of the component than can be either an EL expression of a literal text
converter	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required
validator	null	Method Expr	A method binding expression that refers to a method validating the input

valueChangeListener	null	Method Expr	A method binding expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
var	null	String	Name of the iterator.
itemLabel	null	String	Label of an item.
itemValue	null	Object	Value of an item.
style	null	String	Style of the main container.
styleClass	null	String	Style class of the main container.
widgetVar	null	String	Name of the client side widget.
disabled	false	Boolean	Disables the component.
effect	null	String	Name of the animation to display.
effectSpeed	null	String	Speed of the animation.
addLabel	Add	String	Title of add button.
addAllLabel	Add All	String	Title of add all button.
removeLabel	Remove	String	Title of remove button.
removeAllLabel	Remove All	String	Title of remove all button.
moveUpLabel	Move Up	String	Title of move up button.
moveTopLabel	Move Top	String	Title of move top button.
moveDownLabel	Move Down	String	Title of move down button.
moveBottomLabel	Move Bottom	String	Title of move bottom button.
showSourceControls	false	String	Specifies visibility of reorder buttons of source list.
showTargetControls	false	String	Specifies visibility of reorder buttons of target list.
onTransfer	null	String	Client side callback to execute when an item is transferred from one list to another.
label	null	String	A localized user presentable name.
itemDisabled	false	Boolean	Specified if an item can be picked or not.
showSourceFilter	false	Boolean	Displays and input filter for source list.
showTargetFilter	false	Boolean	Displays and input filter for target list.

filterMatchMode	startsWith	String	Match mode for filtering, valid values are startsWith, contains, endsWith and custom.
filterFunction	null	String	Name of the javascript function for custom filtering.
showCheckbox	false	Boolean	When true, a checkbox is displayed next to each item.
labelDisplay	tooltip	String	Defines how the button labels displayed, valid values are "tooltip" (default) and "inline".
orientation	horizontal	String	Defines layout orientation, valid values are "vertical" and "horizontal".
responsive	false	Boolean	In responsive mode, picklist adjusts itself based on screen width.

Getting started with PickList

You need to create custom model called `org.primefaces.model.DualListModel` to use PickList. As the name suggests it consists of two lists, one is the source list and the other is the target. As the first example we'll create a DualListModel that contains basic Strings.

And bind the cities dual list to the picklist;

When the enclosed form is submitted, the dual list reference is populated with the new values and you can access these values with `DualListModel.getSource()` and `DualListModel.getTarget()` api.

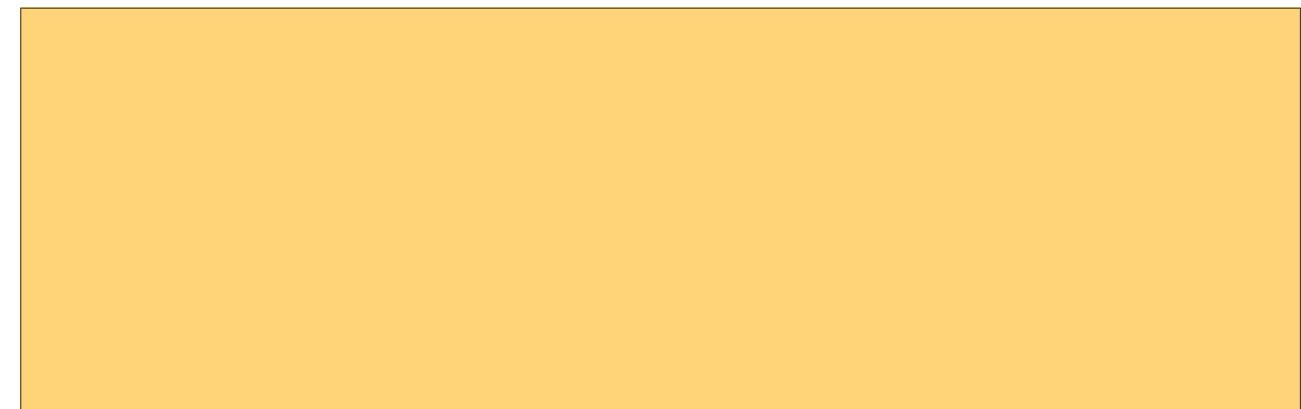

POJOs

Most of the time you would deal with complex pojos rather than simple types like String. This use case is no different except the addition of a converter. Following pickList displays a list of players(name, age ...).

PlayerConverter in this case should implement `javax.faces.convert.Converter` contract and implement `getAsString`, `getAsObject` methods. Note that a converter is always necessary for primitive types like long, integer, boolean as well.

In addition custom content instead of simple strings can be displayed by using columns.

Reordering

PickList support reordering of source and target lists, these are enabled by `showSourceControls` and `showTargetControls` options.

Effects

An animation is displayed when transferring when item to another or reordering a list, default effect is fade and following options are available to be applied using `effect` attribute; blind, bounce, clip, drop, explode, fold, highlight, puff, pulsate, scale, shake, size and slide. `effectSpeed` attribute is used to customize the animation speed, valid values are `slow`, `normal` and `fast`.

Captions

Caption texts for lists are defined with facets named `sourceCaption` and `targetCaption`;

Filtering

PickList provides built-in client side filtering. Filtering is enabled by setting the corresponding filtering attribute of a list. For source list this is *showSourceFilter* and for target list it is *showTargetFilter*. Default match mode is startsWith and contains, endsWith are also available options.

When you need to a custom match mode set *filterMatchMode* to custom and write a javascript function that takes itemLabel and filterValue as parameters. Return false to hide an item and true to display.

onTransfer

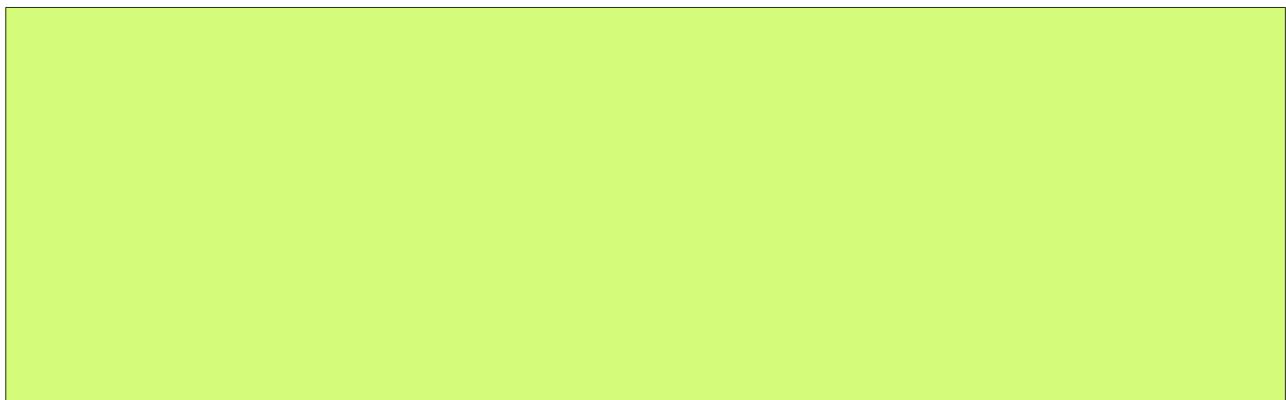

If you'd like to execute custom javascript when an item is transferred, bind your javascript function to *onTransfer* attribute.

Ajax Behavior Events

select	org.primefaces.event.SelectEvent	When an item selected.
unselect	org.primefaces.event.UnselectEvent	When an item unselected.

reorder	javax.faces.event.AjaxBehaviorEvent	When list is reordered.
transfer	Org.primefaces.event.TransferEvent	When an item is moved to another list.

Skinning

PickList resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-picklist	Main container element(table) of picklist
.ui-picklist-list	Lists of a picklist
.ui-picklist-list-source	Source list
.ui-picklist-list-target	Target list
.ui-picklist-source-controls	Container element of source list reordering controls
.ui-picklist-target-controls	Container element of target list reordering controls
.ui-picklist-button	Buttons of a picklist
.ui-picklist-button-move-up	Move up button
.ui-picklist-button-move-top	Move top button
.ui-picklist-button-move-down	Move down button
.ui-picklist-button-move-bottom	Move bottom button
.ui-picklist-button-add	Add button
.ui-picklist-button-add-all	Add all button

.ui-picklist-button-remove-all	Remove all button
.ui-picklist-button-add	Add button
.ui-picklist-vertical	Container element of a vertical picklist

As skinning style classes are global, see the main theming section for more information.

3.102 Poll

Poll is an ajax component that has the ability to send periodical ajax requests.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
widgetVar	null	String	Name of the client side widget.
interval	2	Integer	Interval in seconds to do periodic ajax requests.
update	null	String	Component(s) to be updated with ajax.
listener	null	MethodExpr	A method expression to invoke by polling.
immediate	false	Boolean	Boolean value that determines the phaseId, when true actions are processed at apply_request_values, when false at invoke_application phase.
async	false	Boolean	When set to true, ajax requests are not queued.
process	null	String	Component id(s) to process partially instead of whole view.
onstart	null	String	Javascript handler to execute before ajax request begins.
oncomplete	null	String	Javascript handler to execute when ajax request is completed.
onsuccess	null	String	Javascript handler to execute when ajax request succeeds.
onerror	null	String	Javascript handler to execute when ajax request fails.

global	true	Boolean	Global ajax requests are listened by ajaxStatus component, setting global to false will not trigger ajaxStatus.
delay	null	String	If less than <i>delay</i> milliseconds elapses between calls to <i>request()</i> only the most recent one is sent and all other requests are discarded. If this option is not specified, or if the value of <i>delay</i> is the literal string 'none' without the quotes, no delay is used.
partialSubmit	false	Boolean	Enables serialization of values belonging to the partially processed components only.
partialSubmitFilter	null	String	Selector to use when partial submit is on, default is ":input" to select all descendant inputs of a partially processed components.
autoStart	true	Boolean	In autoStart mode, polling starts automatically on page load, to start polling on demand set to false.
stop	false	Boolean	Stops polling when true.
resetValues	false	Boolean	If true, local values of input components to be updated within the ajax request would be reset.
ignoreAutoUpdate	false	Boolean	If true, components which autoUpdate="true" will not be updated for this request. If not specified, or the value is false, no such indication is made.
timeout	0	Integer	Timeout for the ajax request in milliseconds.
form	null	String	Form to serialize for an ajax request. Default is the enclosing form.

Getting started with Poll

Poll below invokes increment method on CounterBean every 2 seconds and *txt_count* is updated with the new value of the count variable. Note that poll must be nested inside a form.

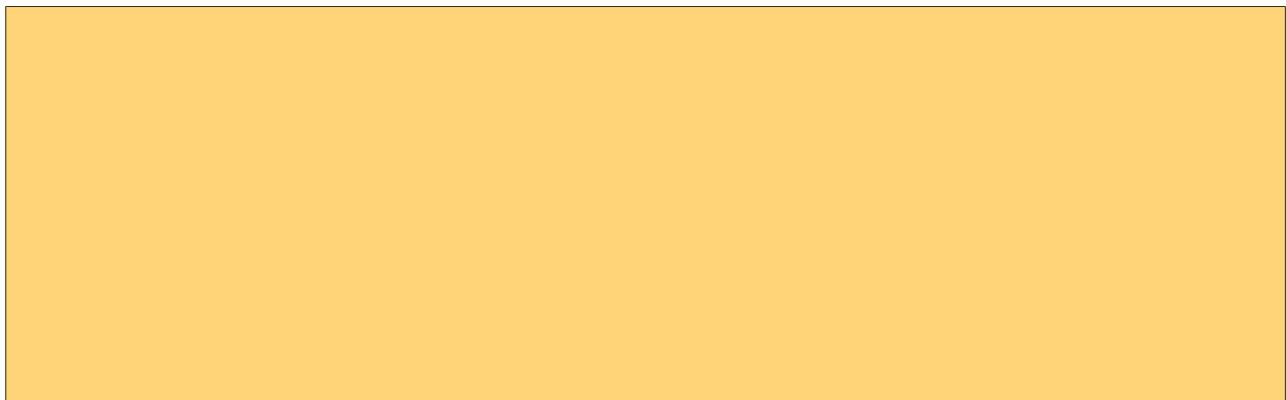

Tuning timing

By default the periodic interval is 2 seconds, this is changed with the `interval` attribute. Following poll works every 5 seconds.

Start and Stop

Poll can be started and stopped using client side api;

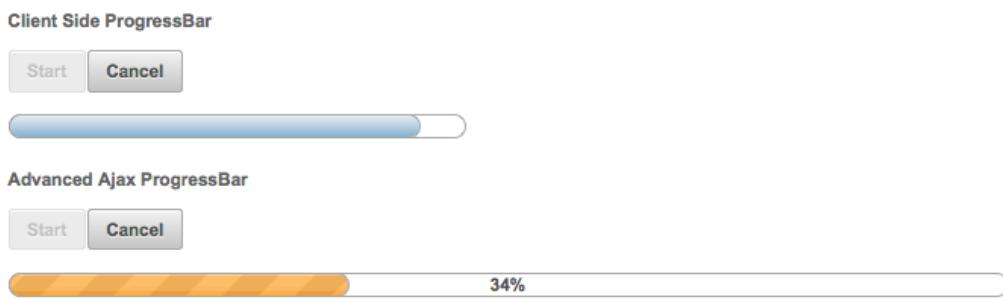

Or bind a boolean variable to the `stop` attribute and set it to false at any arbitrary time.

3.103 Printer

3.104 ProgressBar

ProgressBar is a process status indicator that can either work purely on client side or interact with server side using ajax.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

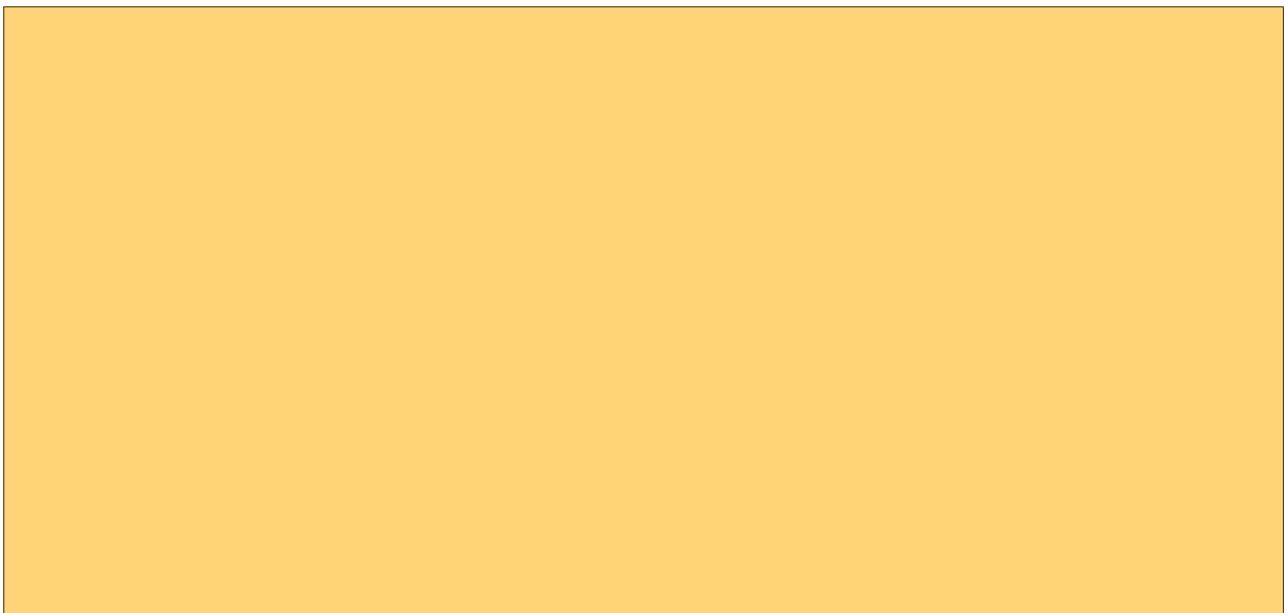

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget
value	0	Integer	Value of the progress bar
disabled	false	Boolean	Disables or enables the progressbar
ajax	false	Boolean	Specifies the mode of progressBar, in ajax mode progress value is retrieved from a backing bean.
interval	3000	Integer	Interval in seconds to do periodic requests in ajax mode.

style	null	String	Inline style of the main container element.
styleClass	null	String	Style class of the main container element.
labelTemplate	{value}	String	Template of the progress label.
displayOnly	false	Boolean	Enables static display mode.
global	true	Boolean	Global ajax requests are listened by ajaxStatus component, setting global to false will not trigger ajaxStatus.

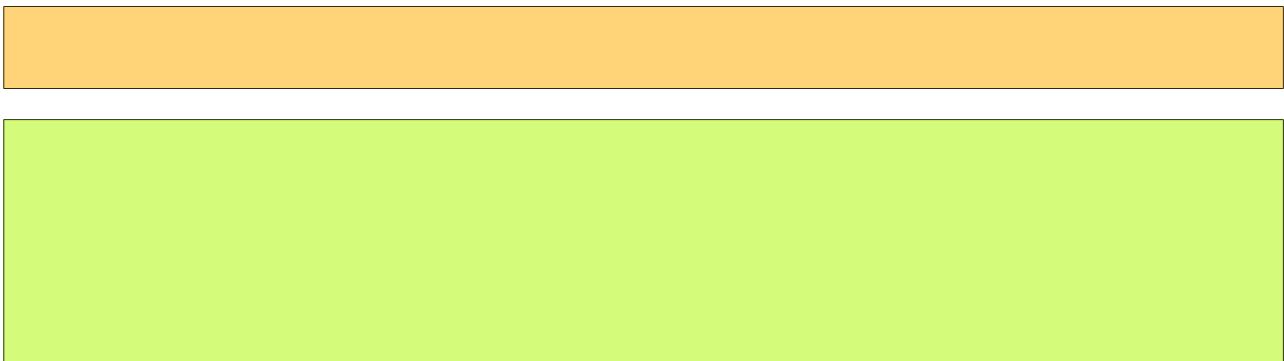

Getting started with the ProgressBar

ProgressBar has two modes, "client"(default) or "ajax". Following is a pure client side progressBar.

Ajax Progress

Ajax mode is enabled by setting ajax attribute to true, in this case the value defined on a managed bean is retrieved periodically and used to update the progress.

Interval

ProgressBar is based on polling and 3000 milliseconds is the default interval for ajax progress bar meaning every 3 seconds progress value will be recalculated. In order to set a different value, use the interval attribute.

Ajax Behavior Events

ProgressBar provides *complete* as the default and only ajax behavior event that is fired when the progress is completed. Example below demonstrates how to use this event.

Display Only

Assume you have a process like a ticket purchase that spans various pages where each page has different use cases such as customer info, seat selection, billing, payment and more. In order to display static value of the process on each page, you can use a static progressBar.

Client Side API

Widget: `PrimeFaces.widget.ProgressBar`

<code>getValue()</code>	-	Number	Returns current value

setValue(value)	value: Value to display	void	Sets current value
start()	-	void	Starts ajax progress bar
cancel()	-	void	Stops ajax progress bar

Skinning

ProgressBar resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-progressbar	Main container.
.ui-progressbar-value	Value of the progressbar
.ui-progressbar-label	Progress label.

As skinning style classes are global, see the main theming section for more information.

3.105 RadioButton

`RadioButton` is a helper component of `SelectOneRadio` to implement custom layouts.

Attributes

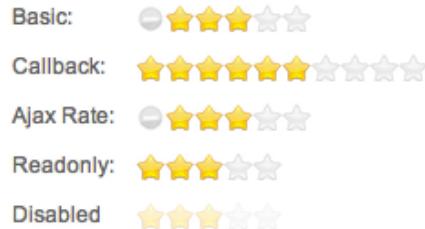

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>value</code>	null	Object	Value of the component than can be either an EL expression of a literal text
<code>converter</code>	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
<code>immediate</code>	0	Boolean	Boolean value that specifies the lifecycle phase the valueChangeEvents should be processed, when true the events will be fired at "apply request values", if immediate is set to false, valueChange Events are fired in "process validations" phase

required	false	Boolean	Marks component as required
validator	null	MethodExpr	A method binding expression that refers to a method validating the input
valueChangeListener	null	MethodExpr	A method binding expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
stars	5	Integer	Number of stars to display
disabled	false	Boolean	Disables user interaction
readonly	false	Boolean	Disables user interaction without disabled visuals.
onRate	null	String	Client side callback to execute when rate happens.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
cancel	true	Boolean	When enabled, displays a cancel icon to reset.

Getting Started with Rating

Rating is an input component that takes an integer variable as its value.

Number of Stars

Default number of stars is 5, if you need less or more stars use the stars attribute. Following rating consists of 10 stars.

Display Value Only

In cases where you only want to use the rating component to display the rating value and disallow user interaction, set *readonly* to true. Using *disabled* attribute does the same but adds disabled visual styles.

Ajax Behavior Events

Rating provides *rate* and *cancel* as ajax behavior events. A defined listener for rate event will be executed by passing an *org.primefaces.event.RateEvent* as a parameter and cancel event will be invoked with no parameter.

Client Side Callbacks

onRate is called when a star is selected with *value* as the only parameter.

Client Side API

Widget: *PrimeFaces.widget.Rating*

<code>getValue()</code>	-	Number	Returns the current value
<code>setValue(value)</code>	<code>value: Value to set</code>	void	Updates rating value with provided one.
<code>disable()</code>	-	void	Disables component.
<code>enable()</code>	-	void	Enables component.
<code>reset()</code>	-	void	Clears the rating.

Skinning

Rating resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-rating	Main container element.
.ui-rating-cancel	Cancel icon
.ui-rating	Default star
.ui-rating-on	Active star

3.107 RemoteCommand

RemoteCommand provides a way to execute backing bean methods directly from javascript.

Info

Tag

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
action	null	Method Expr	A method expression that'd be processed in the partial request caused by uiajax.
actionListener	null	Method Expr	An actionlistener that'd be processed in the partial request caused by uiajax.
immediate	false	Boolean	Boolean value that determines the phaseId, when true actions are processed at apply_request_values, when false at invoke_application phase.
name	null	String	Name of the command
async	false	Boolean	When set to true, ajax requests are not queued.
process	null	String	Component(s) to process partially instead of whole view.
update	null	String	Component(s) to update with ajax.
onstart	null	String	Javascript handler to execute before ajax request is begins.
oncomplete	null	String	Javascript handler to execute when ajax request is completed.
onsuccess	null	String	Javascript handler to execute when ajax request succeeds.
onerror	null	String	Javascript handler to execute when ajax request fails.

global	true	Boolean	Global ajax requests are listened by ajaxStatus component, setting global to false will not trigger ajaxStatus.
delay	null	String	If less than <i>delay</i> milliseconds elapses between calls to <i>request()</i> only the most recent one is sent and all other requests are discarded. If this option is not specified, or if the value of <i>delay</i> is the literal string 'none' without the quotes, no delay is used.
partialSubmit	false	Boolean	Enables serialization of values belonging to the partially processed components only.
partialSubmitFilter	null	String	Selector to use when partial submit is on, default is ":input" to select all descendant inputs of a partially processed components.
autoRun	false	Boolean	When enabled command is executed on page load.
resetValues	false	Boolean	If true, local values of input components to be updated within the ajax request would be reset.
ignoreAutoUpdate	false	Boolean	If true, components which autoUpdate="true" will not be updated for this request. If not specified, or the value is false, no such indication is made.
timeout	0	Integer	Timeout for the ajax request in milliseconds.
form	null	String	Form to serialize for an ajax request. Default is the enclosing form.

Getting started with RemoteCommand

RemoteCommand is used by invoking the command from your javascript code.

That's it whenever you execute your custom javascript function(eg `customfunction()`), a remote call will be made, actionListener is processed and output text is updated. Note that `remoteCommand` must be nested inside a form.

Passing Parameters

Remote command can send dynamic parameters in the following way;

3.108 Repeat

Repeat is an extension to the standard ui:repeat component to provide compatibility between Mojarra and MyFaces. There are no additonal features and usage is same as ui:repeat.

3.109 ResetInput

Input components keep their local values at state when validation fails. ResetInput is used to clear the cached values from state so that components retrieve their values from the backing bean model instead.

Info

Tag	
ActionListener Class	

Attributes

target	null	String	Comma or white space separated list of component identifiers.
clearModel	false	Boolean	When enabled, reset input also sets null values to the bound values so it reset inputs values and model values.

Getting started with ResetInput

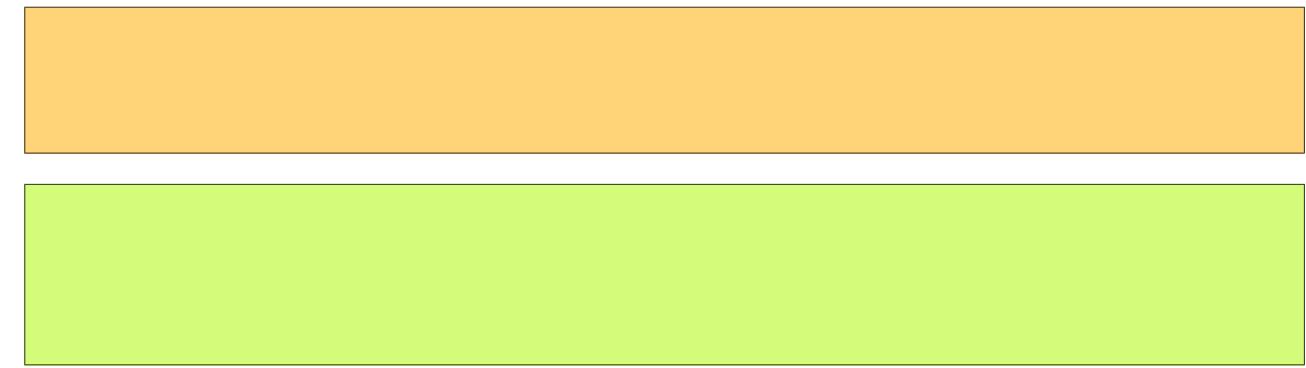

ResetInput is attached to action source components like commandButton and commandLink.

ResetInput supports both ajax and non-ajax actions, for non-ajax actions set immediate true on the source component so lifecycle jumps to render response after resetting. To reset multiple components at once, provide a list of ids or just provide an ancestor component like the panel in sample above.

Reset Programmatically

ResetInput tag is the declarative way to reset input components, another way is resetting programmatically. This is also handy if inputs should get reset based on a condition. Following sample demonstrates how to use RequestContext to do the reset within an ajaxbehavior listener. Parameter of the reset method can be a single clientId or a collection of clientIds.

Tip

p:ajax has built-in *resetValues* attribute to reset values of processed components during a request.

3.110 Resizable

Resizable component is used to make another JSF component resizable.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
for	null	String	Identifier of the target component to make resizable.
aspectRatio	false	Boolean	Defines if aspectRatio should be kept or not.
proxy	false	Boolean	Displays proxy element instead of actual element.
handles	null	String	Specifies the resize handles.
ghost	false	Boolean	In ghost mode, resize helper is displayed as the original element with less opacity.
animate	false	Boolean	Enables animation.
effect	swing	String	Effect to use in animation.
effectDuration	normal	String	Effect duration of animation.
maxWidth	null	Integer	Maximum width boundary in pixels.
maxHeight	null	Integer	Maximum height boundary in pixels.
minWidth	10	Integer	Minimum width boundary in pixels.
minHeight	10	Integer	Maximum height boundary in pixels.

Effects

Resizing can be animated using *animate* option and setting an *effect* name. Animation speed is customized using *effectDuration* option "slow", "normal" and "fast" as valid values.

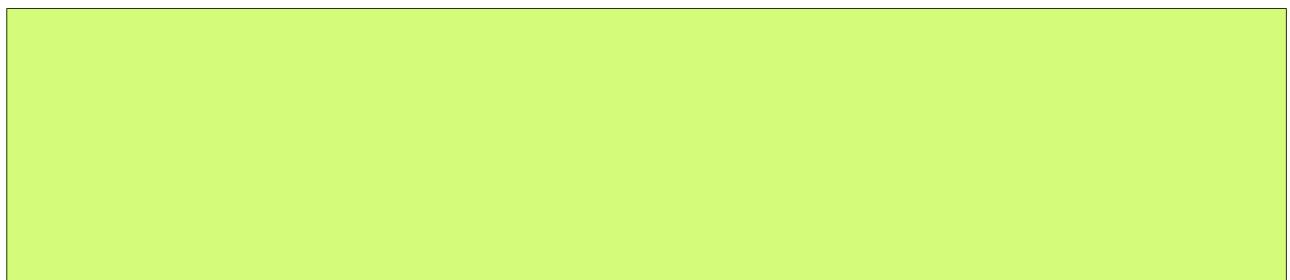

Following is the list of available effect names;

• swing	• easeInQuart	• easeOutSine	• easeInElastic	• easeInBounce
• easeInQuad	• easeOutQuart	• easeInExpo	• easeOutElastic	• easeOutBounce
• easeOutQuad	• easeInOutQuart	• easeOutExpo	• easeInOutElastic	• easeInOutBounce
• easeInOutQuad	• easeInQuint	• easeInOutExpo	• easeInBack	
• easeInCubic	• easeOutQuint	• easeInCirc	• easeOutBack	
• easeOutCubic	• easeInOutQuint	• easeOutCirc	• easeInOutBack	
• easeInOutCubic	• easeInSine	• easeInOutCirc		

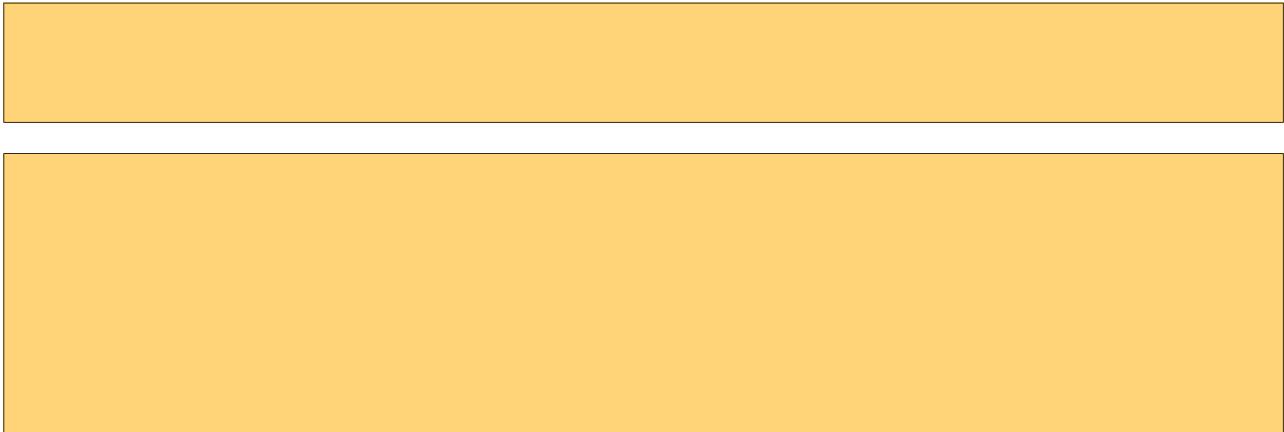

Ajax Behavior Events

Resizable provides default and only *resize* event that is called on resize end. In case you have a listener defined, it will be called by passing an *org.primefaces.event.ResizeEvent* instance as a parameter.

Client Side Callbacks

Resizable has three client side callbacks you can use to hook-in your javascript; *onStart*, *onResize* and *onStop*. All of these callbacks receive two parameters that provide various information about resize event.

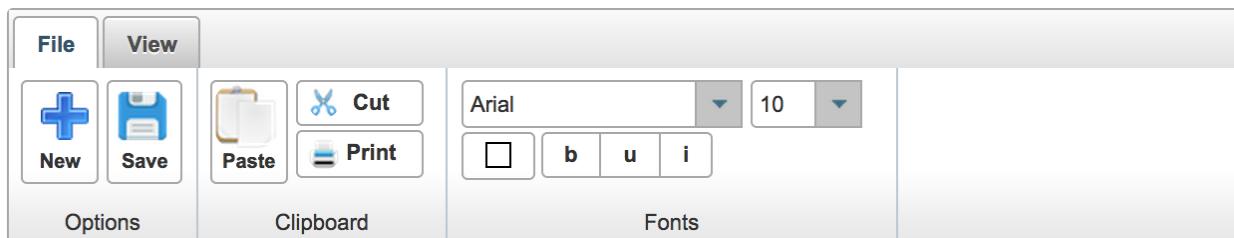

Skinning

.ui-resizable	Element that is resizable
.ui-resizable-handle	Handle element
.ui-resizable-handle-{handlekey}	Particular handle element identified by handlekey like e, s, ne
.ui-resizable-proxy	Proxy helper element for visual feedback

3.111 Ribbon

Ribbon is container component to group different sets of controls in a tabbed layout. Special styling is applied to inner components for a unified look.

Info

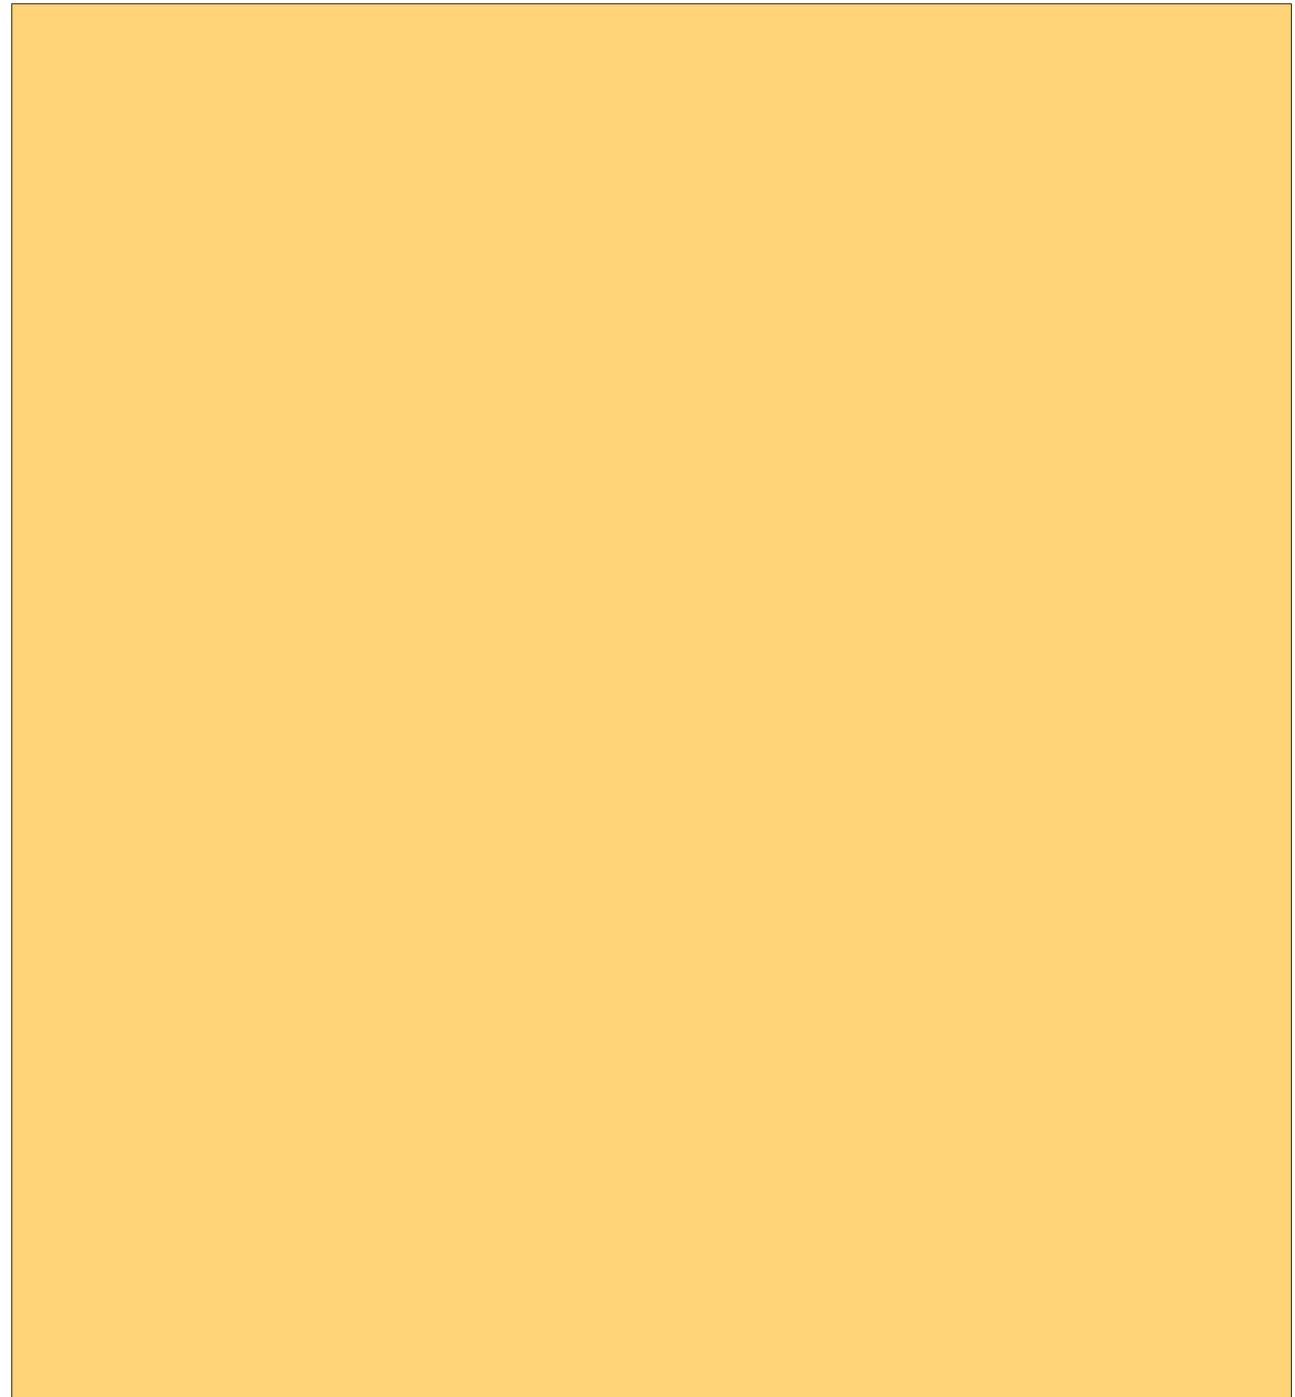

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
style	null	String	Inline style of the container element.
styleClass	null	String	Style class of the container element.
activeIndex	0	Integer	Index of the active tab.

Getting started with Ribbon

Tab and RibbonGroup components are used when building the Ribbon.

Styling

Following components have special styling applied inside ribbon;

- Button
- CommandButton
- SelectOneButton
- SelectManyButton
- SelectOneMenu
- InputText

Default PrimeFaces icons are 16px, in case you need bigger icons add ui-ribbon-bigbutton style class to the button.

Skinning

Ribbon resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes.

.ui-ribbon	Main container element.
.ui-ribbon-groups	Container of ribbon groups in a tab.
.ui-ribbon-group	Ribbon group element.
.ui-ribbon-group-content	Content of a group.
.ui-ribbon-group-label	Label of a group.

Ribbon shares the same structure with TabView for the tabbing functionality, refer to TabView for the styles of the Tabs.

3.112 RibbonGroup

RibbonGroup is a helper component for Ribbon to define groups in a tab.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
style	null	String	Inline style of the container element.
styleClass	null	String	Style class of the container element.
label	null	String	Label of the group.

Getting started with RibbonGroup

Refer to Ribbon component documentation for more information.

3.113 Ring

Ring is a data display component with a circular animation.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

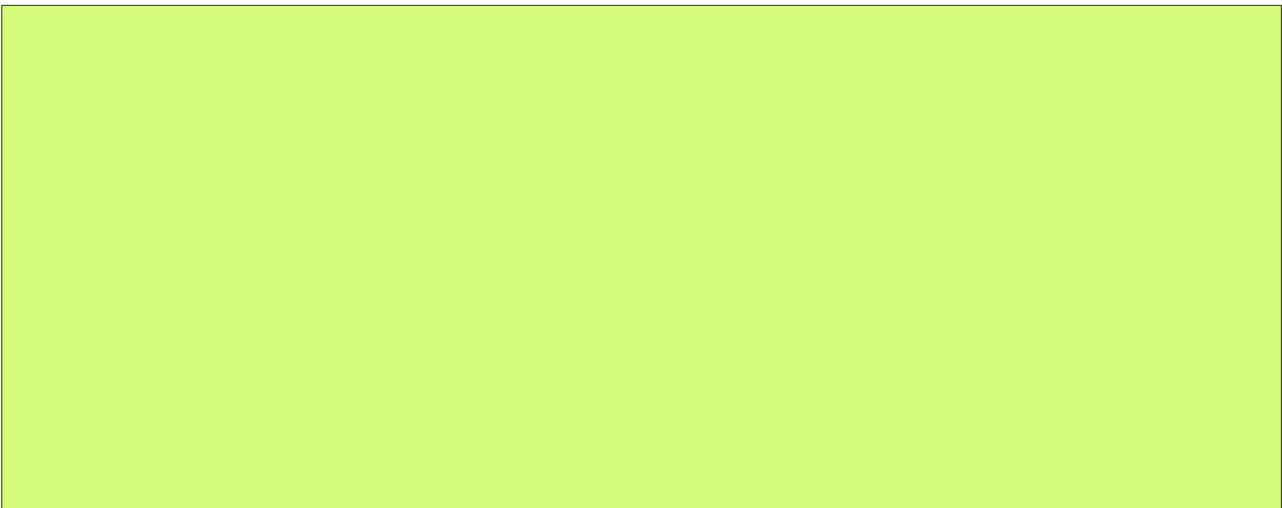

Attributes

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>widgetVar</code>	null	String	Name of the client side widget.
<code>value</code>	null	Object	Collection to display.
<code>var</code>	null	String	Name of the data iterator.
<code>style</code>	null	String	Inline style of the container element.
<code>styleClass</code>	null	String	Style class of the container element.
<code>easing</code>	swing	String	Type of easing to use in animation.
<code>autoplay</code>	false	Boolean	When true, Ring will automatically advance the moving elements to the next child at a regular interval.
<code>autoplayDuration</code>	1000	Integer	Time in milliseconds between animation triggers when a Ring's autoplay is playing.
<code>autoplayPauseOnHover</code>	false	Boolean	When true, Ring will pause autoPlay when the user

			mouseover the Ring container.
autoplayInitialDelay	0	Integer	Time in milliseconds to delay the start of Ring's configured autoplay option.

Getting started with Ring

A collection is required to use the Ring component.

Item Selection

A column is required to process item selection from ring properly.

Easing

Following is the list of available options for easing animation.

<ul style="list-style-type: none"> • swing • easeInQuad • easeOutQuad • easeInOutQuad • easeInCubic • easeOutCubic • easeInOutCubic 	<ul style="list-style-type: none"> • easeInQuart • easeOutQuart • easeInOutQuart • easeInQuint • easeOutQuint • easeInOutQuint • easeInSine 	<ul style="list-style-type: none"> • easeOutSine • easeInExpo • easeOutExpo • easeInOutExpo • easeInCirc • easeOutCirc • easeInOutCirc 	<ul style="list-style-type: none"> • easeInElastic • easeOutElastic • easeInOutElastic • easeInBack • easeOutBack • easeInOutBack 	<ul style="list-style-type: none"> • easeInBounce • easeOutBounce • easeInOutBounce
--	--	---	---	--

Skinning

Ring resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes.

.ui-ring	Main container element.
.ui-ring-item	Each item in the list.

3.114 Row

Row is a helper component for datatable.

Info

Tag	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
style	null	String	Inline style of the component.
styleClas	null	String	Style class of the component.

Getting Started with Row

See datatable grouping section for more information about how row is used.

3.115 RowEditor

RowEditor is a helper component for datatable.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
editTitle	null	String	Title attribute for edit icon.
cancelTitle	null	String	Title attribute for cancel icon.
saveTitle	null	String	Title attribute for save icon.

Getting Started with RowEditor

See inline editing section in datatable documentation for more information about usage.

3.116 RowExpansion

RowExpansion is a helper component of datatable used to implement expandable rows.

Info

Tag	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
styleClass	null	String	Style class of the component.

Getting Started with RowExpansion

See datatable expandable rows section for more information about how rowExpansion is used.

3.117 RowToggler

RowToggler is a helper component for datatable.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

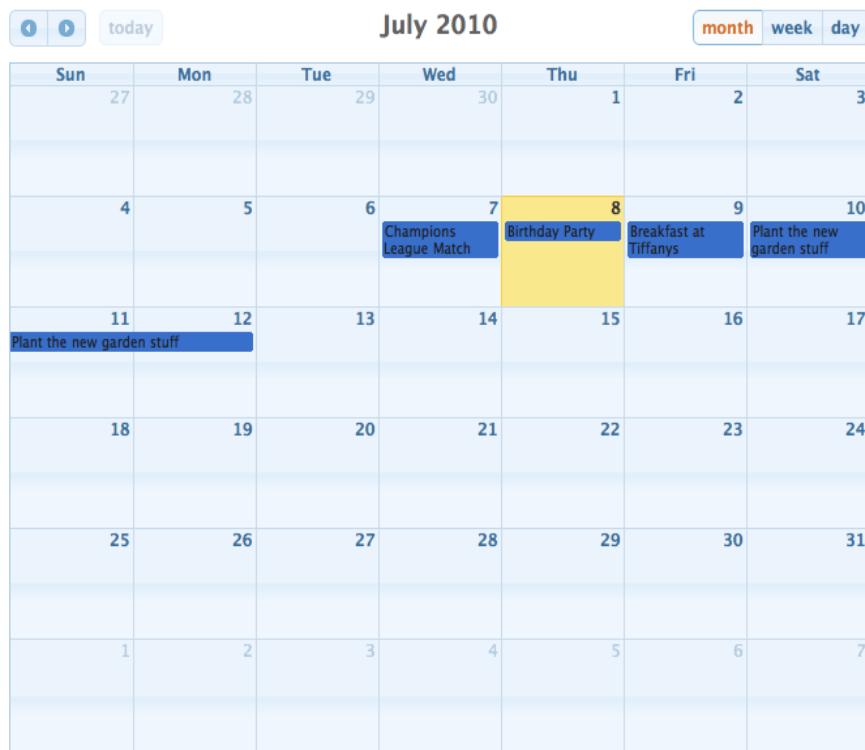

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean

Getting Started with Row

See expandable rows section in datatable documentation for more information about usage.

3.118 Schedule

Schedule provides an Outlook Calendar, iCal like JSF component to manage events.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean

widgetVar	null	String	Name of the client side widget.
value	null	Object	An org.primefaces.model.ScheduleModel instance representing the backed model
locale	null	Object	Locale for localization, can be String or a java.util.Locale instance
aspectRatio	null	Float	Ratio of calendar width to height, higher the value shorter the height is
view	month	String	The view type to use, possible values are 'month', 'agendaDay', 'agendaWeek', 'basicWeek', 'basicDay'
initialDate	null	Object	The initial date that is used when schedule loads. If omitted, the schedule starts on the current date
showWeekends	true	Boolean	Specifies inclusion Saturday/Sunday columns in any of the views
style	null	String	Style of the main container element of schedule
styleClass	null	String	Style class of the main container element of schedule
draggable	true	Boolean	When true, events are draggable.
resizable	true	Boolean	When true, events are resizable.
showHeader	true	Boolean	Specifies visibility of header content.
leftHeaderTemplate	prev, next today	String	Content of left side of header.
centerHeaderTemplate	title	String	Content of center of header.
rightHeaderTemplate	month, agendaWeek, agendaDay	String	Content of right side of header.
allDaySlot	true	Boolean	Determines if all-day slot will be displayed in agendaWeek or agendaDay views
slotMinutes	30	Integer	Interval in minutes in an hour to create a slot.
firstHour	6	Integer	First hour to display in day view.
minTime	null	String	Minimum time to display in a day view.
maxTime	null	String	Maximum time to display in a day view.
axisFormat	null	String	Determines the time-text that will be displayed on the vertical axis of the agenda views.

timeFormat	null	String	Determines the time-text that will be displayed on each event.
columnFormat	null	String	Format for column headers.
timeZone	null	Object	String or a java.util.TimeZone instance to specify the timezone used for date conversion.
ignoreTimezone	true	Boolean	When parsing dates, whether UTC offsets should be ignored while processing event data.
tooltip	false	Boolean	Displays description of events on a tooltip.
clientTimeZone	null	String	Timezone to define how to interpret the dates at browser. Valid values are "false", "local", "UTC" and ids like "America/Chicago".
showWeekNumbers	false	Boolean	Display week numbers in schedule.
extender	null	String	Name of javascript function to extend the options of the underlying fulcalendar plugin.
displayEventEnd	null	String	Whether or not to display an event's end time text when it is rendered on the calendar. Value can be a boolean to globally configure for all views or a comma separated list such as "month:false,basicWeek:true" to configure per view.
weekNumberCalculation	local	String	The method for calculating week numbers that are displayed. Valid values are "local" (default), "ISO" and "custom".
weekNumberCalculator	null	String	Client side function to use in custom weekNumberCalculation.
nextDayThreshold	09:00:00	String	When an event's end time spans into another day, the minimum time it must be in order for it to render as if it were on that day. Default is 09:00:00.
urlTarget	_blank	String	Target for events with urls. Clicking on such events in the schedule will not trigger the selectEvent but open the url using this target instead. Default is "_blank".

Getting started with Schedule

Schedule needs to be backed by an `org.primefaces.model.ScheduleModel` instance, a schedule model consists of `org.primefaces.model.ScheduleEvent` instances.

DefaultScheduleEvent is the default implementation of ScheduleEvent interface. Mandatory properties required to create a new event are the title, start date and end date. Other properties such as allDay get sensible default values.

Table below describes each property in detail.

id	Used internally by PrimeFaces, auto generated.
title	Title of the event.
startDate	Start date of type java.util.Date.
endDate	End date of type java.util.Date.
allDay	Flag indicating event is all day.
styleClass	Visual style class to enable multi resource display.
data	Optional data you can set to be represented by Event.
editable	Whether the event is editable or not.
description	Tooltip text to display on mouseover of an event.

Ajax Behavior Events

Schedule provides various ajax behavior events to respond user actions.

dateSelect	org.primefaces.event.SelectEvent	When a date is selected.
eventSelect	org.primefaces.event.SelectEvent	When an event is selected.
eventMove	org.primefaces.event.ScheduleEntryMoveEvent	When an event is moved.

eventResize	org.primefaces.event.ScheduleEntryResizeEvent	When an event is resized.
viewChange	org.primefaces.event.SelectEvent	When a view is changed.

Ajax Updates

Schedule has a quite complex UI which is generated on-the-fly by the client side PrimeFaces.widget.Schedule widget to save bandwidth and increase page load performance. As a result when you try to update schedule like with a regular PrimeFaces PPR, you may notice a UI lag as the DOM will be regenerated and replaced. Instead, Schedule provides a simple client side api and the *update* method.

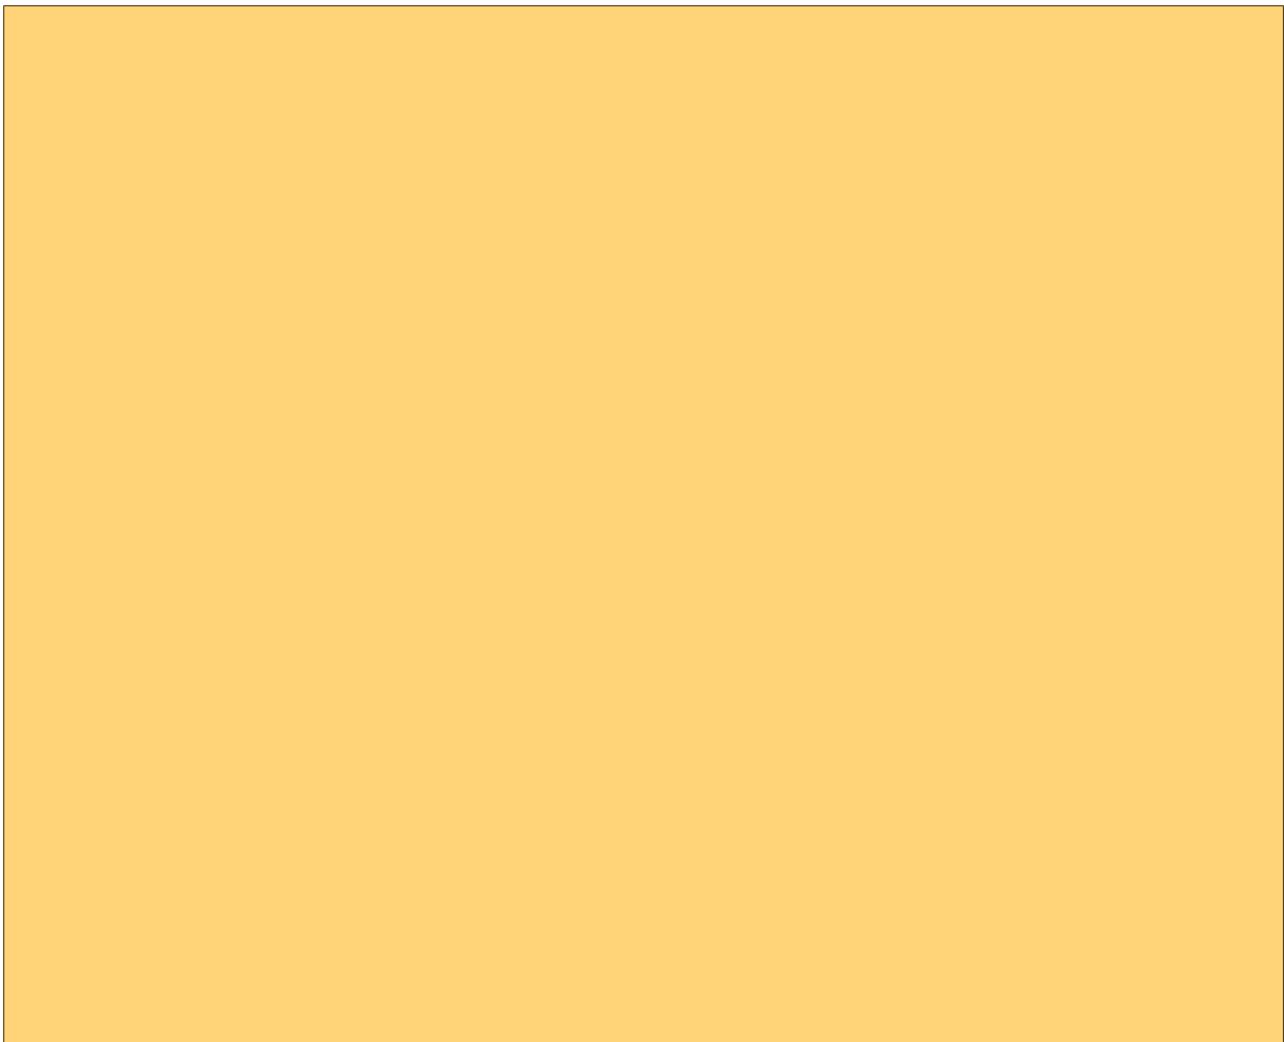

Whenever you call update, schedule will query its server side ScheduleModel instance to check for updates, transport method used to load events dynamically is JSON, as a result this approach is much more effective than updating with regular PPR. An example of this is demonstrated at editable schedule example, save button is calling `PF('widgetvar').update()` at oncomplete event handler.

TimeZone

By default, timezone offsets are ignored. Set `ignoreTimezone` to false so that schedule takes care of timezone differences by calculating the client browser timezone and the event date so that events are displayed at the clients local time.

Editable Schedule

Let's put it altogether to come up a fully editable and complex schedule.

Lazy Loading

Schedule assumes whole set of events are eagerly provided in ScheduleModel, if you have a huge data set of events, lazy loading features would help to improve performance. In lazy loading mode, only the events that belong to the displayed time frame are fetched whereas in default eager more all events need to be loaded.

To enable lazy loading of Schedule events, you just need to provide an instance of `org.primefaces.model.LazyScheduleModel` and implement the `loadEvents` methods. `loadEvents` method is called with new boundaries every time displayed timeframe is changed.

Customizing Header

Header controls of Schedule can be customized based on templates, valid values of template options are;

- title: Text of current month/week/day information
- prev: Button to move calendar back one month/week/day.
- next: Button to move calendar forward one month/week/day.
- prevYear: Button to move calendar back one year
- nextYear: Button to move calendar forward one year
- today: Button to move calendar to current month/week/day.
- viewName: Button to change the view type based on the view type.

These controls can be placed at three locations on header which are defined with *leftHeaderTemplate*, *rightHeaderTemplate* and *centerTemplate* attributes.

<input type="button" value="today"/>	<input type="button" value="month"/>	<input type="button" value="week"/>	<input type="button" value="day"/>	<input type="button" value="◀"/>	<input type="button" value="▶"/>

Locale Support

By default locale information is retrieved from the view's locale and can be overridden by the `locale` attribute. `Locale` attribute can take a locale key as a String or a `java.util.Locale` instance. Default language of labels are English and you need to add the necessary translations to your page manually as PrimeFaces does not include language translations. PrimeFaces Wiki Page for `PrimeFacesLocales` is a community driven page where you may find the translations you need. Please contribute to this wiki with your own translations.

Translation is a simple javascript object, we suggest adding the code to a javascript file and include in your application. Following is a Turkish calendar.

Event Limit

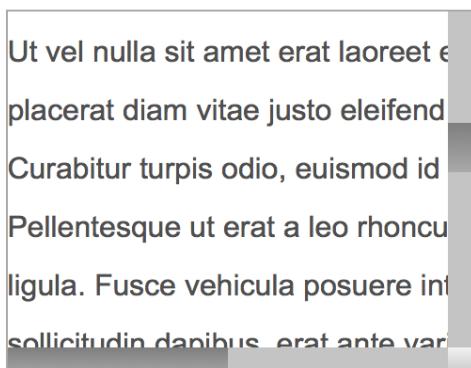

To display a link when there are too many events on a slot, use `setEventLimit(true)` on model.

Skinning

Schedule resides in a main container which `style` and `styleClass` attributes apply. As skinning style classes are global, see the main theming section for more information.

3.119 ScrollPanel

ScrollPane is used to display scrollable content with theme aware scrollbars instead of native browser scrollbars.

Info

Tag

Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
style	null	String	Inline style of the container element.
styleClass	null	String	Style class of the container element.
mode	default	String	Scrollbar display mode, valid values are default and native.

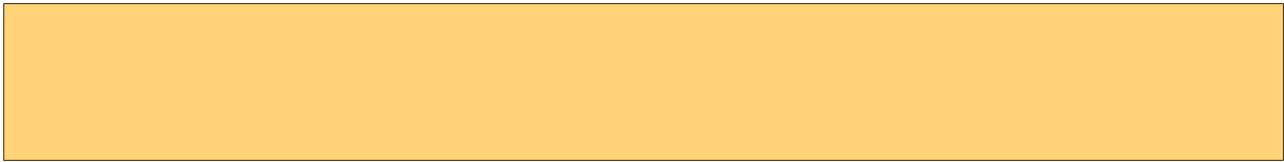

Getting started with ScrollPanel

In order to get scrollable content, width and/or height should be defined.

Native ScrollBars

By default, scrollPanel displays theme aware scrollbars, setting mode option to native displays browser scrollbars.

Skinning

ScrollPane resides in a main container which *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-scrollpanel	Main container element.
.ui-scrollpanel-container	Overflow container.
.ui-scrollpanel-content	Content element.
.ui-scrollbar-hbar	Horizontal scrollbar container.
.ui-scrollbar-vbar	Vertical scrollbar container.
.ui-scrollbar-track	Track element.
.ui-scrollbar-drag	Drag element.

3.120 SelectBooleanButton

SelectBooleanButton is used to select a binary decision with a toggle button.

I accept terms and conditions:

binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component referring to a List.
converter	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required
validator	null	Method Expr	A method expression that refers to a method validationg the input
valueChangeListener	null	Method Expr	A method expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.

converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
disabled	false	Boolean	Disables the component.
label	null	String	User presentable name.
onchange	null	String	Callback to execute on value change.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the container.
onLabel	null	String	Label to display when button is selected.
offLabel	null	String	Label to display when button is unselected.
onIcon	null	String	Icon to display when button is selected.
offIcon	null	String	Icon to display when button is unselected.
tabindex	0	String	Position of the element in the tabbing order.
title	null	String	Advisory tooltip information.
onfocus	null	String	Client side callback to execute when button receives focus.
onblur	null	String	Client side callback to execute when button loses focus.

Getting started with SelectBooleanButton

SelectBooleanButton usage is similar to selectBooleanCheckbox.

Skinning

SelectBooleanButton resides in a main container which *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-selectbooleanbutton	Main container element.

3.121 SelectBooleanCheckbox

SelectBooleanCheckbox is an extended version of the standard checkbox with theme integration.

valueChangeListener	null	Method Expr	A method expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.

validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
disabled	false	Boolean	Disables the component.
label	null	String	User presentable name.
onchange	null	String	Callback to execute on value change.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the container.
itemLabel	null	String	Label displayed next to checkbox.
tabindex	null	String	Specifies tab order for tab key navigation.
onfocus	null	String	Client side callback to execute when checkbox receives focus.
onblur	null	String	Client side callback to execute when checkbox loses focus.
title	null	String	Advisory tooltip information.

Getting started with SelectBooleanCheckbox

SelectBooleanCheckbox usage is same as the standard one.

Client Side API

Widget: *PrimeFaces.widget.SelectBooleanCheckbox*

check()	-	void	Checks the checkbox.
uncheck()	-	void	Unchecks the checkbox.
toggle()	-	void	Toggles check state.

Skinning

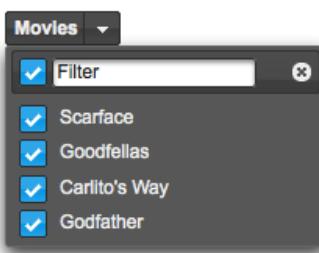

SelectBooleanCheckbox resides in a main container which *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-chkbox	Main container element.
.ui-chkbox-box	Container of checkbox icon.
.ui-chkbox-icon	Checkbox icon.

.ui-chkbox-icon	Checkbox label.

3.122 SelectCheckboxMenu

SelectCheckboxMenu is a multi select component that displays options in an overlay.

<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>value</code>	null	Object	Value of the component referring to a List.
<code>converter</code>	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
<code>immediate</code>	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
<code>required</code>	false	Boolean	Marks component as required
<code>validator</code>	null	MethodExpr	A method expression that refers to a method validating the input
<code>valueChangeListener</code>	null	MethodExpr	A method expression that refers to a method for

			handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
disabled	false	Boolean	Disables the component.
label	null	String	User presentable name.
onchange	null	String	Callback to execute on value change.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the container.
scrollHeight	null	Integer	Height of the overlay.
onShow	null	String	Client side callback to execute when overlay is displayed.
onHide	null	String	Client side callback to execute when overlay is hidden.
filter	false	Boolean	Renders an input field as a filter.
filterMatchMode	startsWith	String	Match mode for filtering, valid values are startsWith, contains, endsWith and custom.
filterFunction	null	String	Client side function to use in custom filtering.
caseSensitive	false	Boolean	Defines if filtering would be case sensitive.
panelStyle	null	String	Inline style of the overlay.
panelStyleClass	null	String	Style class of the overlay.
appendTo	null	String	Appends the overlay to the element defined by search expression. Defaults to document body.
tabindex	null	String	Position of the element in the tabbing order.
title	null	String	Advisory tooltip information.
showHeader	true	Boolean	When enabled, the header of panel is displayed.
updateLabel	false	Boolean	When enabled, the selected items are displayed on label.
multiple	false	Boolean	Whether to show selected items as multiple labels.

Getting started with SelectCheckboxMenu

SelectCheckboxMenu usage is same as the standard selectManyCheckbox or PrimeFaces selectManyCheckbox components.

Labels

Selected items are not displayed as the component label by default, setting *updateLabel* to true displays item as a comma separated list and for an advanced display use *multiple* property instead which renders the items as separate tokens similar to the chips component.

Filtering

When filtering is enabled with setting *filter* on, an input field is rendered at overlay header and on keyup event filtering is executed on client side using *filterMatchMode*. Default modes of filterMatchMode are startsWith, contains, endsWith and custom. Custom mode requires a javascript function to do the filtering.

.ui-selectcheckboxmenu	Main container element.
.ui-selectcheckboxmenu-label-container	Label container.
.ui-selectcheckboxmenu-label	Label.
.ui-selectcheckboxmenu-trigger	Dropdown icon.
.ui-selectcheckboxmenu-panel	Overlay panel.
.ui-selectcheckboxmenu-items	Option list container.
.ui-selectcheckboxmenu-item	Each options in the collection.
.ui-chkbox	Container of a checkbox.
.ui-chkbox-box	Container of checkbox icon.
.ui-chkbox-icon	Checkbox icon.

3.123 SelectManyButton

SelectManyButton is a multi select component using button UI.

			validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
disabled	false	Boolean	Disables the component.
label	null	String	User presentable name.
layout	lineDirection	String	Layout of the checkboxes, valid values are <i>lineDirection</i> , <i>pageDirection</i> , <i>grid</i> , <i>responsive</i> and <i>custom</i> .
columns	0	Integer	Number of columns in grid layout.
onchange	null	String	Callback to execute on value change.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the container.
tabindex	null	String	Position of the component in the tabbing order.

Getting started with SelectManyCheckbox

SelectManyCheckbox usage is same as the standard one.

Layouts

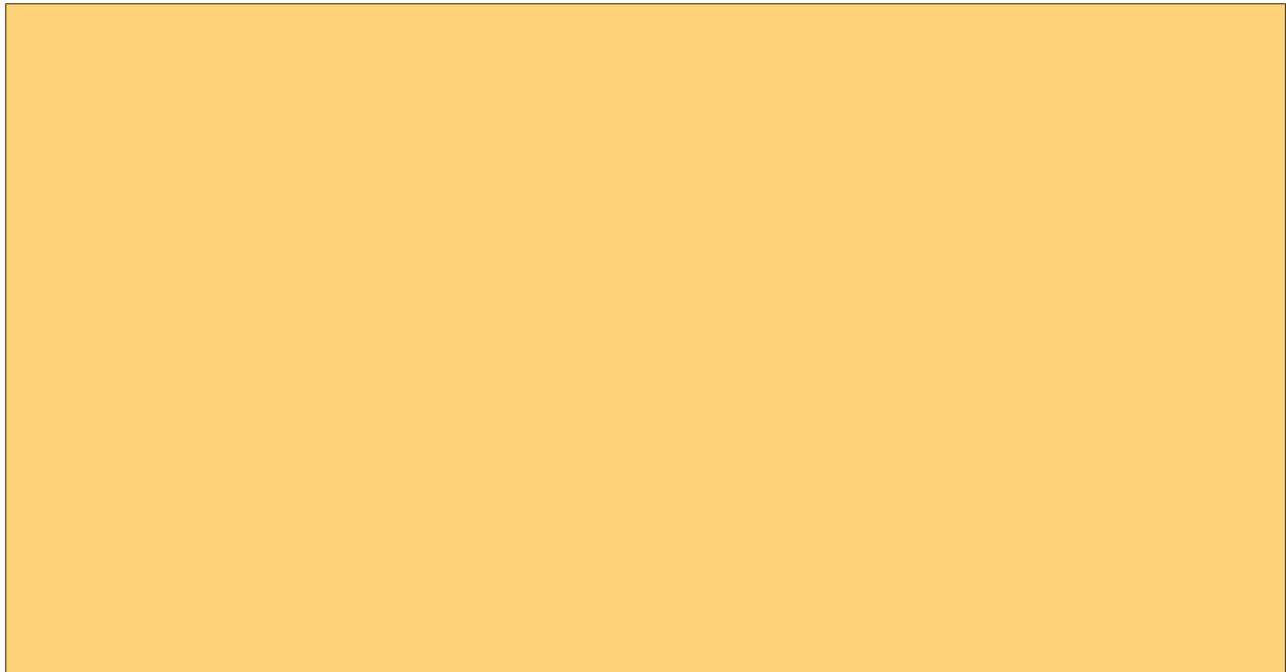

There are five layouts options for the checkboxes;

- *lineDirection*: Checkboxes are displayed horizontally
- *pageDirection*: Checkboxes are displayed vertically
- *grid*: Checkboxes are displayed in grid with given columns value.
- *responsive*: This is same as grid except, checkboxes are displayed vertically after a certain screen breakpoint.
- *custom*: In this mode, selectManyCheckbox leaves the layout to you using p:checkbox components. Next section provides more detail about this mode.

Custom Layout

Custom layout is defined using the standalone checkbox components that match the selectItems of the selectManyCheckbox by their itemIndex option. Note that in this mode selectManyCheckbox does not render anything visible.

Following example uses customizable Grid CSS layout.

Skinning

SelectManyCheckbox resides in a main container which *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-selectmanycheckbox	Main container element.
.ui-chkbox	Container of a checkbox.
.ui-chkbox-box	Container of checkbox icon.
.ui-chkbox-icon	Checkbox icon.

3.125 SelectManyMenu

SelectManyMenu is an extended version of the standard SelectManyMenu.

<code>validator</code>	null	MethodExpr	A method expression that refers to a method validating the input
<code>valueChangeListener</code>	null	MethodExpr	A method expression that refers to a method for

			handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
disabled	false	Boolean	Disables the component.
label	null	String	User presentable name.
onchange	null	String	Callback to execute on value change.
onclick	null	String	Callback for click event.
ondblclick	null	String	Callback for dblclick event.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the container.
tabindex	null	String	Position of the input element in the tabbing order.
var	null	String	Name of iterator to be used in custom content display.
showCheckbox	false	Boolean	When true, a checkbox is displayed next to each item.
filter	false	Boolean	Displays an input filter for the list.
filterMatchMode	null	String	Match mode for filtering, valid values are startsWith (default), contains, endsWith and custom.
filterFunction	null	String	Client side function to use in custom filterMatchMode.
caseSensitive	false	Boolean	Defines if filtering would be case sensitive.
scrollHeight	null	Integer	Defines the height of the scrollable area

Getting started with SelectManyMenu

SelectManyMenu usage is same as the standard one.

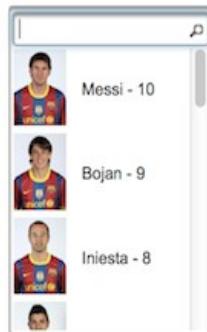

Custom Content

Custom content can be displayed for each item using column components.

Filtering

Filtering is enabled by setting filter attribute to true. There are four filter modes; *startsWith*, *contains*, *endsWith* and *custom*. In custom mode, *filterFunction* must be defined as the name of the javascript function that takes the item value and filter as parameters to return a boolean to accept or reject a value. To add a filter to previous example;

Checkbox

SelectManyMenu has built-in support for checkbox based multiple selection, when enabled by *showCheckbox* option, checkboxes are displayed next to each column.

Skinning

SelectManyMenu resides in a container that *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-selectmanymenu	Main container element.
.ui-selectlistbox-item	Each item in list.

3.126 SelectOneButton

SelectOneButton is an input component to do a single select.

value	null	Object	Value of the component.
converter	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	0	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	0	Boolean	Marks component as required
validator	null	MethodExpr	A method expression that refers to a method validationong the input

valueChangeListener	null	MethodExpr	A method expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
effect	blind	String	Name of the toggle animation.
effectSpeed	normal	String	Duration of toggle animation, valid values are "slow", "normal" and "fast".
disabled	false	Boolean	Disables the component.
label	null	String	User presentable name.
onchange	null	String	Client side callback to execute on value change.
onkeyup	null	String	Client side callback to execute on keyup.
onkeydown	null	String	Client side callback to execute on keydown.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the container.
var	null	String	Name of the item iterator.
height	auto	Integer	Height of the overlay.
tabindex	null	String	Tabindex of the input.
editable	false	Boolean	When true, input becomes editable.
filter	false	Boolean	Renders an input field as a filter.
filterMatchMode	startsWith	String	Match mode for filtering, valid values are startsWith, contains, endsWith and custom.
filterFunction	null	String	Client side function to use in custom filtering.
caseSensitive	false	Boolean	Defines if filtering would be case sensitive.
maxlength			

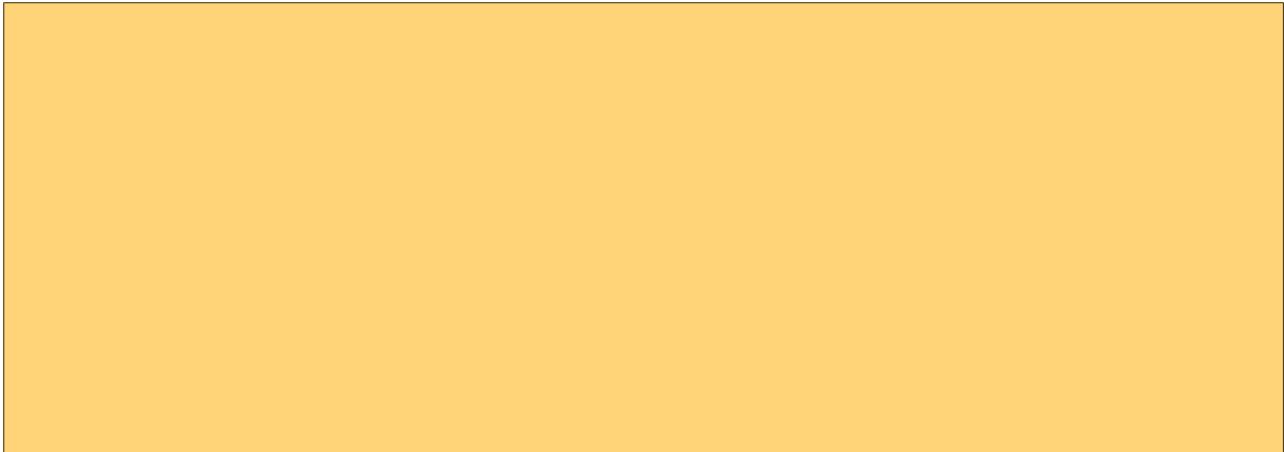

labelTemplate	null	String	Displays label of the element in a custom template. Valid placeholder is {0}.
onfocus	null	String	Client side callback to execute when element receives focus.
onblur	null	String	Client side callback to execute when element loses focus.
autoWidth	true	Boolean	Calculates a fixed width based on the width of the maximum option label. Set to false for custom width.

Getting started with SelectOneMenu

Basic SelectOneMenu usage is same as the standard one.

Custom Content

SelectOneMenu can display custom content in overlay panel by using column component and the var option to refer to each item.

Effects

An animation is executed to show and hide the overlay menu, default effect is fade and following options are available for *effect* attribute; blind, bounce, clip, drop, explode, fold, highlight, puff, pulsate, scale, shake, size, slide and none.

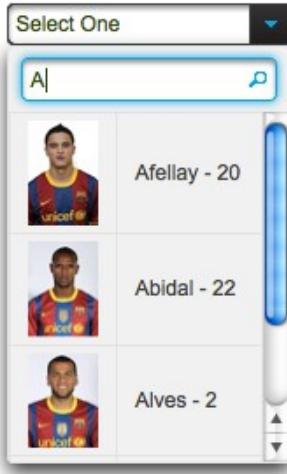

Editable

Editable SelectOneMenu provides a UI to either choose from the predefined options or enter a manual input. Set editable option to true to use this feature.

Filtering

When filtering is enabled with setting *filter* on, an input field is rendered at overlay header and on keyup event filtering is executed on client side using *filterMatchMode*. Default modes of filterMatchMode are startsWith, contains, endsWith and custom. Custom mode requires a javascript function to do the filtering.

Ajax Behavior Events

In addition to the standard events like "change", custom "itemSelect" event is also available to invoke when an item is selected from dropdown.

Client Side API

Widget: *PrimeFaces.widget.SelectOneMenu*

show()	-	void	Shows overlay menu.
hide()	-	void	Hides overlay menu.
blur()	-	void	Invokes blur event.
focus()	-	void	Invokes focus event.
enable()	-	void	Enables component.
disable()	-	void	Disabled component.
selectValue()	value: itemValue	void	Selects given value.
getSelectedValue()	-	Object	Returns value of selected item.
getSelectedLabel()		String	Returns label of selected item.

Skinning

SelectOneMenu resides in a container element that *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-selectonemenu	Main container.
.ui-selectonemenu-label	Label of the component.
.ui-selectonemenu-trigger	Container of dropdown icon.

.ui-selectonemenu-items	Items list.
.ui-selectonemenu-items	Each item in the list.

3.129 SelectOneRadio

SelectOneRadio is an extended version of the standard SelectOneRadio with theme integration.

Info

Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component referring to a List.
converter	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
immediate	0	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	0	Boolean	Marks component as required
validator	null	MethodExpr	A method expression that refers to a method validationg the input
valueChangeListener	null	MethodExpr	A method expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.

converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
disabled	false	Boolean	Disables the component.
label	null	String	User presentable name.
layout	line Direction	String	Layout of the radiobuttons, valid values are <i>lineDirection, pageDirection, custom, responsive and grid</i> .
columns	0	Integer	Number of columns in grid layout.
onchange	null	String	Callback to execute on value change.
onclick	null	String	Callback to execute on click of a radio.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the container.
tabindex	null	String	Specifies the tab order of element in tab navigation.
plain	false	Boolean	Plain mode displays radiobuttons using native browser rendering instead of themes.

Getting started with SelectOneRadio

SelectOneRadio usage is same as the standard one.

Custom Layout

Standard selectOneRadio component only supports horizontal and vertical rendering of the radio buttons with a strict table markup. PrimeFaces SelectOneRadio on the other hand provides a flexible layout option so that radio buttons can be located anywhere on the page. This is implemented by setting layout option to custom and with standalone radioButton components. Note that in custom mode, selectOneRadio itself does not render any output.

RadioButton's for attribute should refer to a selectOneRadio component and itemIndex points to the index of the selectItem. When using custom layout option, selectOneRadio component should be placed above any radioButton that points to the selectOneRadio.

Client Side API

Widget: *PrimeFaces.widget.SelectOneRadio*

enable()	-	void	Enables component.
disable()	-	void	Disables component.

Skinning

SelectOneRadio resides in a main container which *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-selectoneradio	Main container element.
.ui-radiobutton	Container of a radio button.
.ui-radiobutton-box	Container of radio button icon.
.ui-radiobutton-icon	Radio button icon.

3.130 Separator

Separator displays a horizontal line to separate content.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
title	null	String	Advisory tooltip information.
style	null	String	Inline style of the separator.
styleClass	null	String	Style class of the separator.

Getting started with Separator

In its simplest form, separator is used as;

Dimensions

Separator renders a `<hr />` tag which style and styleClass options apply.

Special Separators

Separator can be used inside other components such as menu when supported.

Skinning

As mentioned in dimensions section, style and styleClass options can be used to style the separator. Following is the list of structural style classes;

.ui-separator	Separator element

As skinning style classes are global, see the main theming section for more information.

3.131 Signature

Signature is used to draw a signature as an input. Various options such as background color, foreground color, thickness are available for customization. Signature also supports touch enabled devices and legacy browsers without canvas support.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>value</code>	null	Object	Value of the component than can be either an EL expression of a literal text
<code>converter</code>	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
<code>immediate</code>	false	Boolean	Boolean value that specifies the lifecycle phase the valueChangeEvents should be processed, when true

			the events will be fired at "apply request values", if immediate is set to false, valueChange Events are fired in "process validations" phase
required	False	Boolean	Marks component as required
validator	null	Method Expr	A method binding expression that refers to a method validating the input
valueChangeListener	null	Method Expr	A method binding expression that refers to a method for handling a valuechangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget
backgroundColor	#ffffff	String	Background color as hex value
color	#000000	String	Foreground color as hex value
thickness	2	Integer	Thickness of the lines
style	null	String	Inline style of the component
styleClass	null	String	Style class of the component.
readonly	false	Boolean	When enabled, signature is used for display purposes only.
guideline	false	Boolean	Adds a guideline when enabled
guidelineColor	#a0a0a0	String	Color of the guideline
guidelineOffset	25	String	Offset of guideline from bottom
guidelineIndent	10	Boolean	Guide line indent from the edges
onchange	null	String	Client side callback to execute when signature changes.
base64Value	null	String	Write-only value used to pass the value in base64 to backing bean

Getting started with Signature

Value is interpreted as JSON so at backing bean should be a string value.

Guideline

Guideline adds a horizontal line to indicate the area to sign, attributes such as guidelineColor, guidelineOffset and guidelineIndent can be used to customize this area.

Convert to Binary

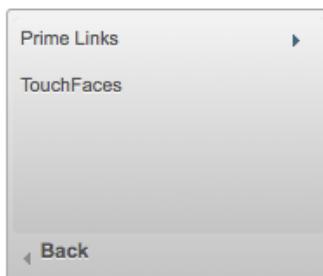

Signature value is represented as a JSON array at client side and this value is also passed as a java string to backend bean, however if you need to convert this to a byte[] or write it to an outputStream following helper class can be used.

3.132 SlideMenu

SlideMenu is used to display nested submenus with sliding animation.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

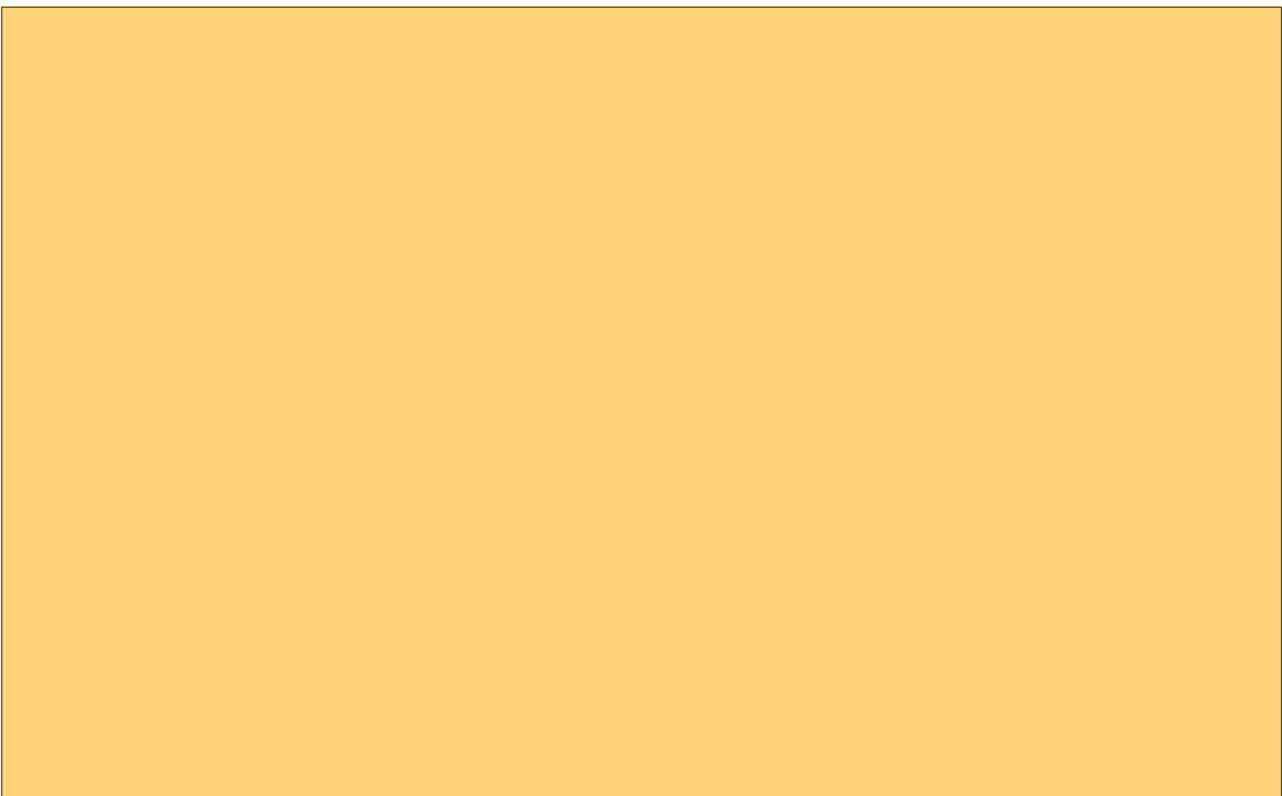

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
model	null	MenuModel	MenuModel instance for programmatic menu.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
backLabel	Back	String	Text for back link.
trigger	null	String	Id of the component whose triggerEvent will show the dynamic positioned menu.
my	null	String	Corner of menu to align with trigger element.

at	null	String	Corner of trigger to align with menu element.
overlay	false	Boolean	Defines positioning, when enabled menu is displayed with absolute position relative to the trigger. Default is false, meaning static positioning.
triggerEvent	click	String	Event name of trigger that will show the dynamic positioned menu.

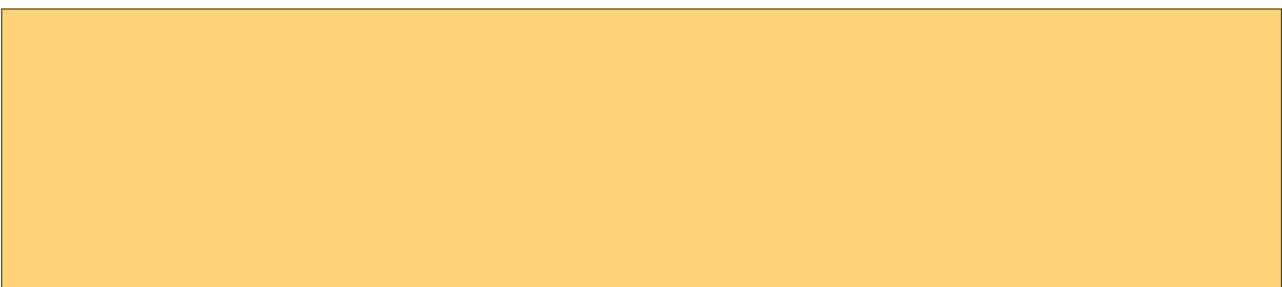

Getting started with the SlideMenu

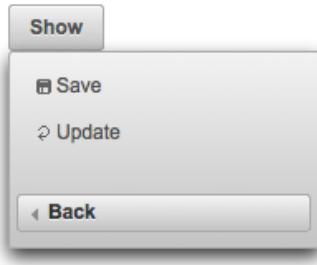

SlideMenu consists of submenus and menuitems, submenus can be nested and each nested submenu will be displayed with a slide animation.

Overlay

SlideMenu can be positioned relative to a trigger component, following sample attaches a slideMenu to the button so that whenever the button is clicked menu will be displayed in an overlay itself.

Client Side API

Widget: `PrimeFaces.widget.SlideMenu`

<code>show()</code>	-	<code>void</code>	Shows overlay menu.
<code>hide()</code>	-	<code>void</code>	Hides overlay menu.
<code>align()</code>	-	<code>void</code>	Aligns overlay menu with trigger.

Skinning

SlideMenu resides in a main container which `style` and `styleClass` attributes apply. Following is the list of structural style classes;

<code>.ui-menu .ui-slidemenu</code>	Container element of menu.
<code>.ui-slidemenu-wrapper</code>	Wrapper element for content.
<code>.ui-slidemenu-content</code>	Content container.
<code>.ui-slidemenu-backward</code>	Back navigator.
<code>.ui-menu-list</code>	List container
<code>.ui-menuitem</code>	Each menu item
<code>.ui-menuitem-link</code>	Anchor element in a link item
<code>.ui-menuitem-text</code>	Text element in an item

As skinning style classes are global, see the main theming section for more information.

3.133 Slider

Slider is used to provide input with various customization options like orientation, display modes and skinning.

Info

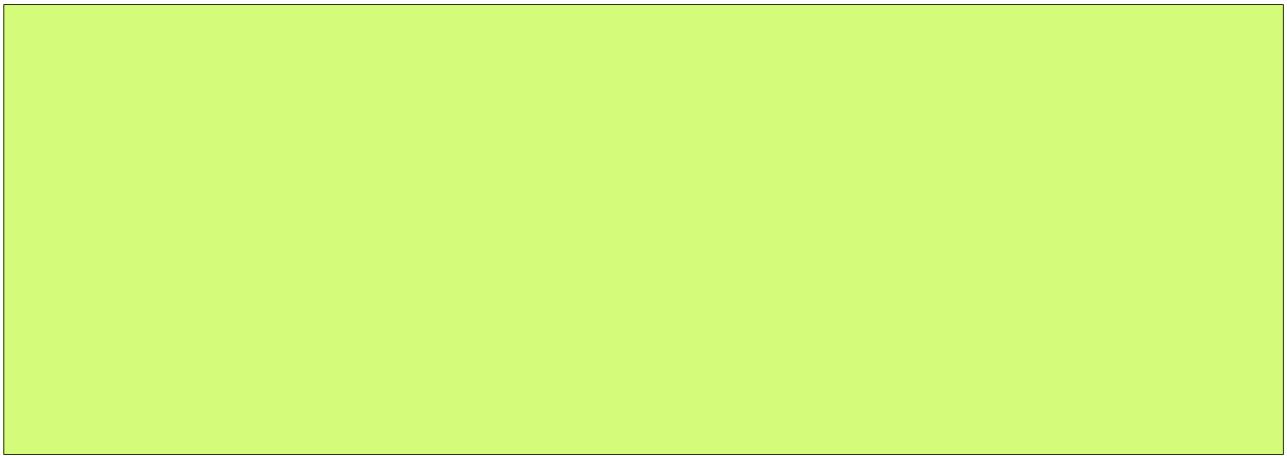

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

onSlide	null	String	Client side callback to execute during sliding.
onSlideEnd	null	String	Client side callback to execute when slide ends.
range	false	Boolean	When enabled, two handles are provided for selection a range.
displayTemplate	null	String	String template to use when updating the display. Valid placeholders are {value}, {min} and {max}.

Getting started with Slider

Slider requires an input component to work with, *for* attribute is used to set the id of the input component whose input will be provided by the slider.

Display Value

Using *display* feature, you can present a readonly display value and still use slider to provide input, in this case *for* should refer to a hidden input to bind the value.

Set ratio to %21

Vertical Slider

By default slider's orientation is horizontal, vertical sliding is also supported and can be set using the *type* attribute.

Step

Step factor defines the interval between each point during sliding. Default value is one and it is customized using *step* option.

Animation

Sliding is animated by default, if you want to turn it off animate attribute set the *animate* option to false.

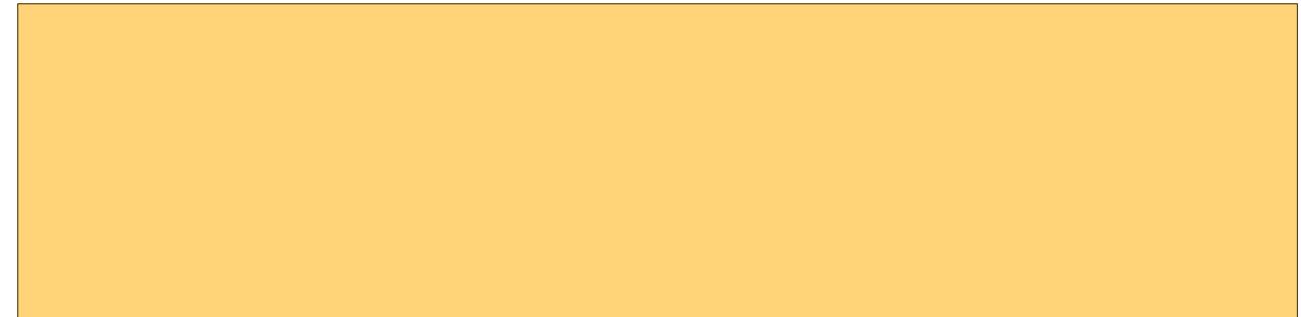

Boundaries

Maximum and minimum boundaries for the sliding is defined using *minValue* and *maxValue* attributes. Following slider can slide between -100 and +100.

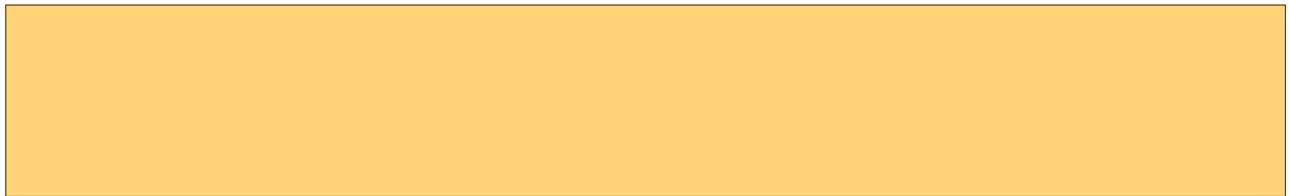

Range Slider

Selecting a range with min-max values are supported by slider. To enable this feature, set *range* attribute to true and provide a comma separate pair of input fields to attach min-max values. Following sample demonstrates a range slider along with the display template feature for feedback;

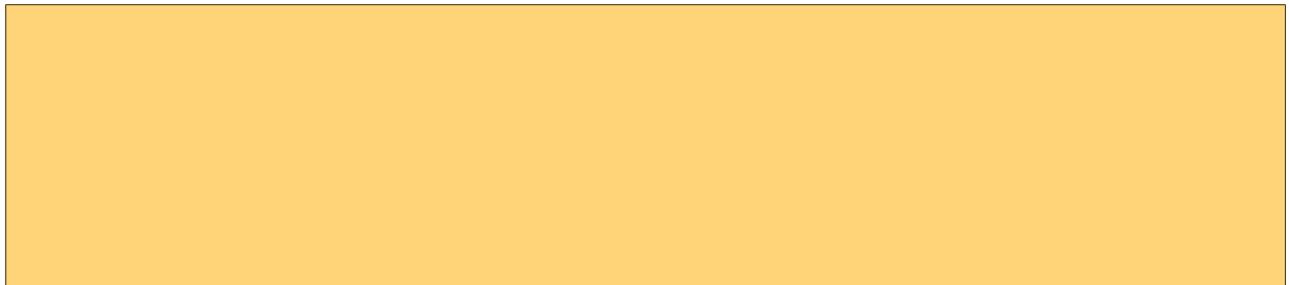

Client Side Callbacks

Slider provides three callbacks to hook-in your custom javascript, `onSlideStart`, `onSlide` and `onSlideEnd`. All of these callbacks receive two parameters; slide event and the ui object containing information about the event.

Ajax Behavior Events

Slider provides one ajax behavior event called `slideEnd` that is fired when the slide completes. If you have a listener defined, it will be called by passing `org.primefaces.event.SlideEndEvent` instance. Example below adds a message and displays it using growl component when slide ends.

Client Side API

Widget: *PrimeFaces.widget.Slider*

getValue()	-	Number	Returns the current value
setValue(value)	value: Value to set	void	Updates slider value with provided one.
disable()	index: Index of tab to disable	void	Disables slider.
enable()	index: Index of tab to enable	void	Enables slider.

Skinning

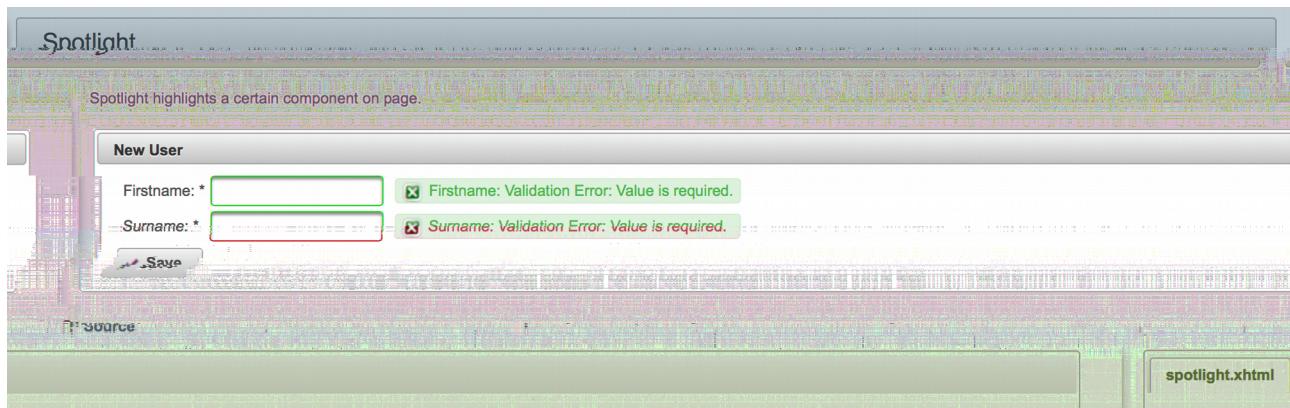

Slider resides in a main container which *style* and *styleClass* attributes apply. These attributes are handy to specify the dimensions of the slider. Following is the list of structural style classes;

.ui-slider	Main container element
.ui-slider-horizontal	Main container element of horizontal slider
.ui-slider-vertical	Main container element of vertical slider
.ui-slider-handle	Slider handle

As skinning style classes are global, see the main theming section for more information.

3.134 Spotlight

Spotlight highlights a certain component on page.

Info

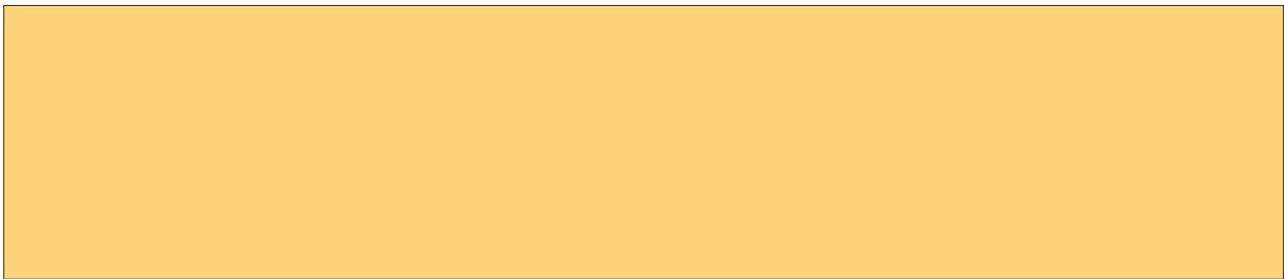

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	false	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
target	null	String	Component to highlight.
active	false	Boolean	When true, spotlight is activated initially.

Getting started with Spotlight

Spotlight is accessed using client side api. Clicking the button highlights the panel below;

Client Side API

Widget: *PrimeFaces.widget.Spotlight*

show()	-	void	Highlights target.
hide()	-	void	Removes highlight.

Skinning

Slider resides in a main container which *style* and *styleClass* attributes apply. These attributes are handy to specify the dimensions of the slider. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-spotlight	Mask element, common to all regions.
.ui-spotlight-top	Top mask element.
.ui-spotlight-bottom	Bottom mask element.
.ui-spotlight-left	Left mask element.
.ui-spotlight-right	Right mask element.

3.135 Socket

Socket component is an agent that creates a push channel between the server and the client.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
channel	null	Object	Channel name of the connection.
transport	websocket	String	Desired protocol to be used valid values are websocket (default), sse, streaming, long-polling, jsonp.
fallbackTransport	long-polling	String	Fallback protocol to be used when desired transport is not supported in environment, valid values are websocket, sse, streaming, long-polling (default), jsonp.
onMessage	null	String	Javascript event handler that is processed when server publishes data.
onError	null	String	Javascript event handler that is processed when there is an error.
onClose	null	String	Javascript event handler for onClose callback of atmosphere.
onOpen	null	String	Javascript event handler for onOpen callback of atmosphere.
onReconnect	null	String	Javascript event handler for onReconnect callback of atmosphere.

onMessagePublished	null	String	Javascript event handler for onMessagePublished callback of atmosphere.
onTransportFailure	null	String	Javascript event handler for onTransportFailure callback of atmosphere.
onLocalMessage	null	String	Javascript event handler for onLocalMessage callback of atmosphere.
autoConnect	true	Boolean	Connects to channel on page load when enabled.

Getting Started with the Socket

See chapter 5, "PrimeFaces Push" for detailed information.

3.136 Spacer

Spacer is used to put spaces between elements.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
title	null	String	Advisory tooltip information.
style	null	String	Inline style of the spacer.
styleClass	null	String	Style class of the spacer.
width	null	String	Width of the space.
height	null	String	Height of the space.

Getting started with Spacer

Spacer is used by either specifying width or height of the space.

Spacer in this example separates this text

and

this text.

3.137 Spinner

Spinner is an input component to provide a numerical input via increment and decrement buttons.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

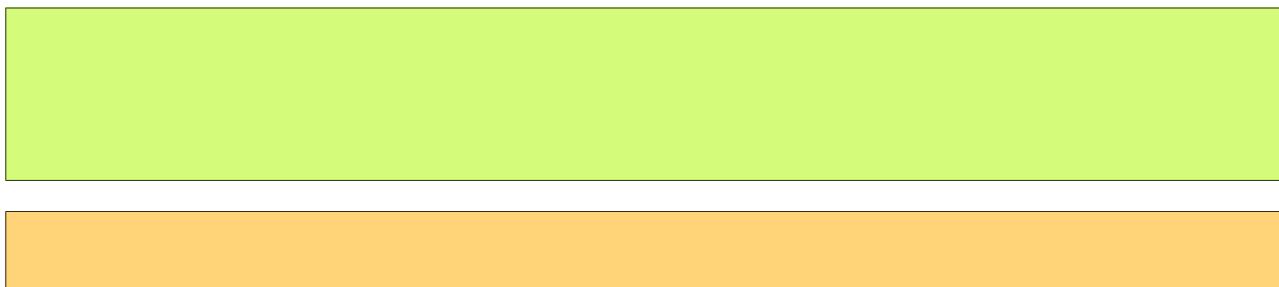

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component than can be either an EL expression <code>#{bindings.value}</code> or a plain Java object.

		Expr	method for handling a valuchangeevent
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
stepFactor	1	Double	Stepping factor for each increment and decrement
min	null	Double	Minimum boundary value
max	null	Double	Maximum boundary value
prefix	null	String	Prefix of the input
suffix	null	String	Suffix of the input
accesskey	null	String	Access key that when pressed transfers focus to the input element.
alt	null	String	Alternate textual description of the input field.
autocomplete	null	String	Controls browser autocomplete behavior.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
disabled	false	Boolean	Disables input field
label	null	String	A localized user presentable name.
lang	null	String	Code describing the language used in the generated markup for this component.
maxlength	null	Integer	Maximum number of characters that may be entered in this field.
onblur	null	String	Client side callback to execute when input element loses focus.
onchange	null	String	Client side callback to execute when input element loses focus and its value has been modified since gaining focus.
onclick	null	String	Client side callback to execute when input element is clicked.
ondblclick	null	String	Client side callback to execute when input element is double clicked.
onfocus	null	String	Client side callback to execute when input element receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over input element.

onkeypress	null	String	Client side callback to execute when a key is pressed and released over input element.
onkeyup	null	String	Client side callback to execute when a key is released over input element.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over input element
onmousemove	null	String	Client side callback to execute when a pointer button is moved within input element.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from input element.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto input element.
onmouseup	null	String	Client side callback to execute when a pointer button is released over input element.
onselect	null	String	Client side callback to execute when text within input element is selected by user.
placeholder	null	String	Specifies a short hint.
readonly	false	Boolean	Flag indicating that this component will prevent changes by the user.
size	null	Integer	Number of characters used to determine the width of the input element.
style	null	String	Inline style of the input element.
styleClass	null	String	Style class of the input element.
tabindex	null	Integer	Position of the input element in the tabbing order.
title	null	String	Advisory tooltip information.

Getting Started with Spinner

Spinner is an input component and used just like a standard input text.

Step Factor

Other than integers, spinner also support decimals so the fractional part can be controlled with spinner as well. For decimals use the stepFactor attribute to specify stepping amount. Following example uses a stepFactor 0.25.

Output of this spinner would be;

After an increment happens a couple of times.

Prefix and Suffix

Prefix and Suffix options enable placing fixed strings on input field. Note that you would need to use a converter to avoid conversion errors since prefix/suffix will also be posted.

Boundaries

In order to restrict the boundary values, use *min* and *max* options.

Ajax Spinner

Spinner can be ajaxified using client behaviors like f:ajax or p:ajax. In example below, an ajax request is done to update the outputtext with new value whenever a spinner button is clicked.

Skinning

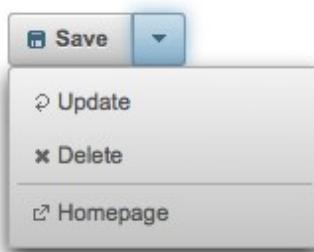

Spinner resides in a container element that using *style* and *styleClass* applies. Following is the list of structural style classes;

.ui-spinner	Main container element of spinner
.ui-spinner-input	Input field
.ui-spinner-button	Spinner buttons
.ui-spinner-button-up	Increment button
.ui-spinner-button-down	Decrement button

As skinning style classes are global, see the main theming section for more information.

3.138 SplitButton

SplitButton displays a command by default and additional ones in an overlay.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>value</code>	null	String	Label for the button
<code>action</code>	null	MethodE xpr/String	A method expression or a String outcome that'd be processed when button is clicked.
<code>actionListener</code>	null	MethodE xpr	An actionlistener that'd be processed when button is clicked.
<code>immediate</code>	false	Boolean	Boolean value that determines the phaseId, when true actions are processed at apply_request_values, when false at invoke_application phase.
<code>type</code>	submit	String	Sets the behavior of the button.
<code>ajax</code>	true	Boolean	Specifies the submit mode, when set to true(default), submit would be made with Ajax.

async	false	Boolean	When set to true, ajax requests are not queued.
process	null	String	Component(s) to process partially instead of whole view.
update	null	String	Component(s) to be updated with ajax.
onstart	null	String	Client side callback to execute before ajax request begins.
oncomplete	null	String	Client side callback to execute when ajax request is completed.
onsuccess	null	String	Client side callback to execute when ajax request succeeds.
onerror	null	String	Client side callback to execute when ajax request fails.
global	true	Boolean	Defines whether to trigger ajaxStatus or not.
delay	null	String	If less than <i>delay</i> milliseconds elapses between calls to <i>request()</i> only the most recent one is sent and all other requests are discarded. If this option is not specified, or if the value of <i>delay</i> is the literal string 'none' without the quotes, no delay is used.
partialSubmit	false	Boolean	Enables serialization of values belonging to the partially processed components only.
partialSubmitFilter	null	String	Selector to use when partial submit is on, default is ":input" to select all descendant inputs of a partially processed components.
resetValues	false	Boolean	If true, local values of input components to be updated within the ajax request would be reset.
ignoreAutoUpdate	false	Boolean	If true, components which autoUpdate="true" will not be updated for this request. If not specified, or the value is false, no such indication is made.
timeout	0	Integer	Timeout for the ajax request in milliseconds.
style	null	String	Inline style of the button element.
styleClass	null	String	StyleClass of the button element.
onblur	null	String	Client side callback to execute when button loses focus.
onchange	null	String	Client side callback to execute when button loses focus and its value has been modified since gaining focus.
onclick	null	String	Client side callback to execute when button is clicked.
ondblclick	null	String	Client side callback to execute when button is double clicked.
onfocus	null	String	Client side callback to execute when button receives focus.
onkeydown	null	String	Client side callback to execute when a key is pressed down over button.

onkeypress	null	String	Client side callback to execute when a key is pressed and released over button.
onkeyup	null	String	Client side callback to execute when a key is released over button.
onmousedown	null	String	Client side callback to execute when a pointer button is pressed down over button.
onmousemove	null	String	Client side callback to execute when a pointer button is moved within button.
onmouseout	null	String	Client side callback to execute when a pointer button is moved away from button.
onmouseover	null	String	Client side callback to execute when a pointer button is moved onto button.
onmouseup	null	String	Client side callback to execute when a pointer button is released over button.
onselect	null	String	Client side callback to execute when text within button is selected by user.
accesskey	null	String	Access key that when pressed transfers focus to the button.
alt	null	String	Alternate textual description of the button.
dir	null	String	Direction indication for text that does not inherit directionality. Valid values are LTR and RTL.
disabled	false	Boolean	Disables the button.
image	null	String	Style class for the button icon. (deprecated: use icon)
label	null	String	A localized user presentable name.
lang	null	String	Code describing the language used in the generated markup for this component.
tabindex	null	Integer	Position of the button element in the tabbing order.
title	null	String	Advisory tooltip information.
readonly	false	Boolean	Flag indicating that this component will prevent changes by the user.
icon	null	String	Icon of the button as a css class.
iconPos	left	String	Position of the icon.
widgetVar	null	String	Name of the client side widget.
appendTo	null	String	Appends the overlay to the element defined by search expression. Defaults to document body.
form	null	String	Form to serialize for an ajax request. Default is the enclosing form.

menuStyleClass	null	String	Style class of the overlay menu element.

Getting started with SplitButton

SplitButton usage is similar to a regular commandButton. Additional commands are placed inside the component and displayed in an overlay. In example below, clicking the save button invokes save method of the bean and updates messages. Nested options defined as menuitems do ajax, non-ajax requests as well as regular navigation to an external url.

Client Side API

Widget: *PrimeFaces.widget.SplitButton*

show()	-	void	Displays overlay.
hide()	-	void	Hides overlay.

Skinning

SplitButton renders a container element which *style* and *styleClass* applies. Following is the list of structural style classes;

.ui-splitbutton	Container element.
.ui-button	Button element
.ui-splitbutton-menubutton	Dropdown button
.ui-button-text-only	Button element when icon is not used
.ui-button-text	Label of button
.ui-menu	Container element of menu
.ui-menu-list	List container
.ui-menuitem	Each menu item
.ui-menuitem-link	Anchor element in a link item

.ui-menuitem-text	Text element in an item

As skinning style classes are global, see the main theming section for more information.

3.139 Submenu

Submenu is nested in menu components and represents a sub menu items.

Info

Tag	
Component Class

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
label	null	String	Label of the submenu header.
icon	null	String	Icon of a submenu, see menuitem to see how it is used
style	null	String	Inline style of the submenu.
styleClass	null	String	Style class of the submenu.
expanded	false	Boolean	Defines the state of submenu.

Getting started with Submenu

Please see Menu or Menubar section to find out how submenu is used with the menus.

3.140 Stack

Stack is a navigation component that mimics the stacks feature in Mac OS X.

Info

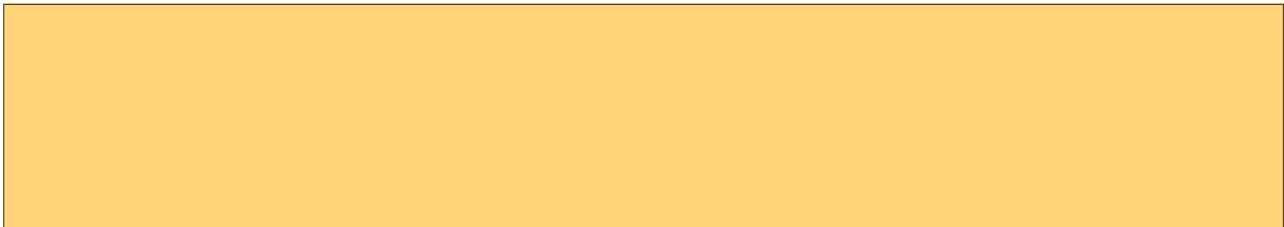

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

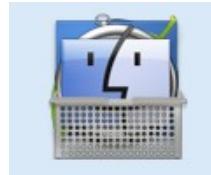

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
icon	null	String	An optional image to contain stacked items.
openSpeed	300	String	Speed of the animation when opening the stack.
closeSpeed	300	Integer	Speed of the animation when opening the stack.
widgetVar	null	String	Name of the client side widget.
model	null	MenuModel	MenuModel instance to create menus programmatically
expanded	false	Boolean	Whether to display stack as expanded or not.

Getting started with Stack

Each item in the stack is represented with menuitems. Stack below has five items with different icons and labels.

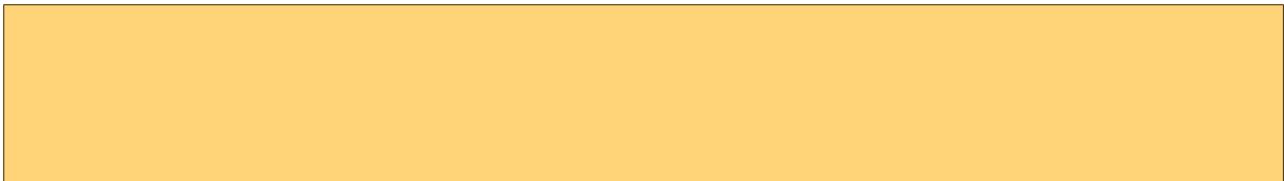

Initially stack will be rendered in collapsed mode;

Location

Stack is a fixed positioned element and location can be change via css. There's one important css selector for stack called `.ui-stack`. Override this style to change the location of stack.

Dynamic Menus

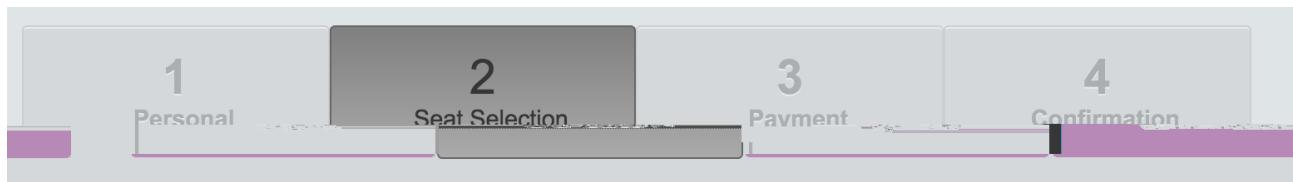

Menus can be created programmatically as well, see the dynamic menus part in menu component section for more information and an example.

Skinning

<code>.ui-stack</code>	Main container element of stack
<code>.ui-stack ul li</code>	Each item in stack
<code>.ui-stack ul li img</code>	Icon of a stack item
<code>.ui-stack ul li span</code>	Label of a stack item

3.141 Steps

Steps components is an indicator for the steps in a workflow. Layout of steps component is optimized for responsive design.

Info

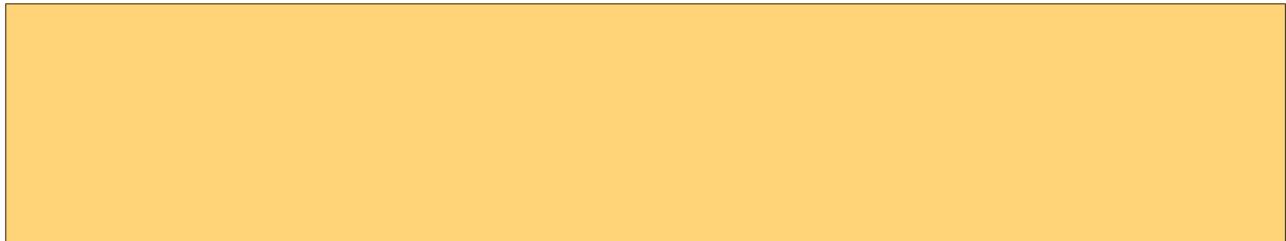

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
model	null	MenuModel	MenuModel instance to build menu dynamically.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
activeIndex	0	Integer	Index of the active tab.
widgetVar	null	String	Name of the client side widget.
readonly	true	Boolean	Defines whether items would be clickable or not.

Getting started with Steps

Steps requires menuitems as children components, each menuitem is rendered as a step. Just like in any other menu component, menuitems can be utilized to do ajax requests, non-ajax requests and simple GET navigations.

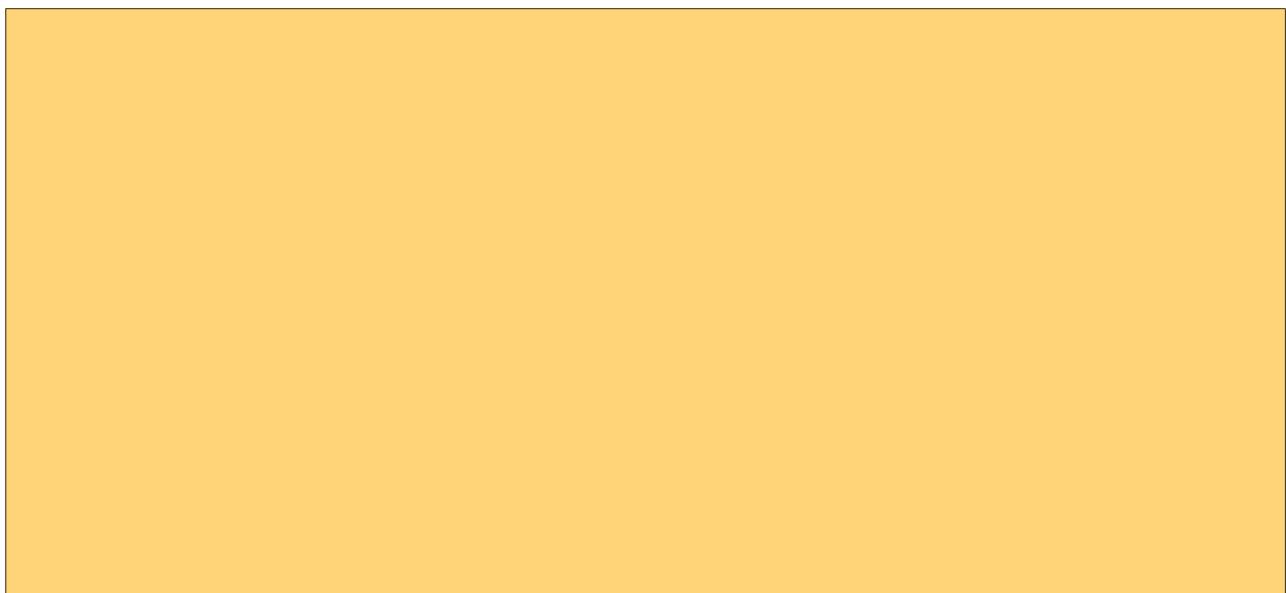

Skinning Steps

Steps resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

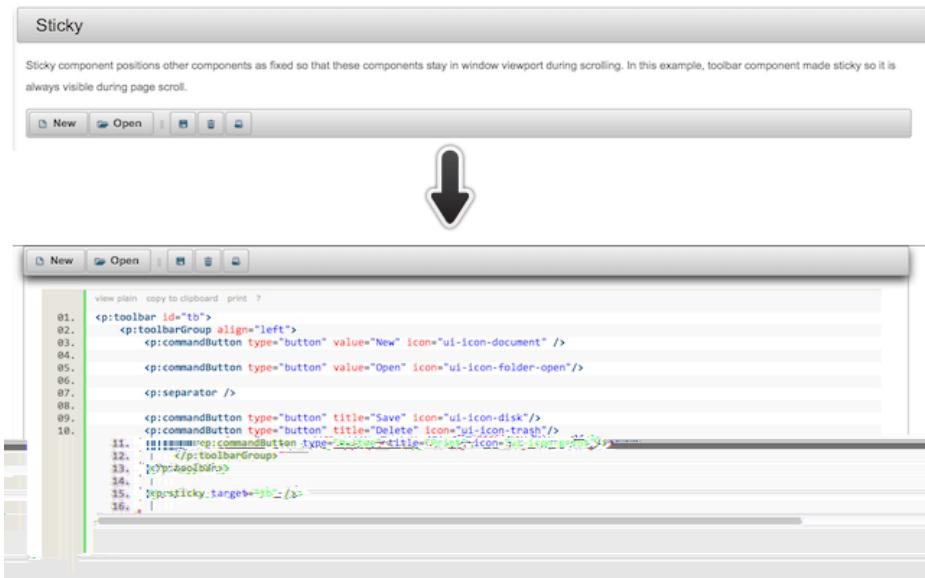

.ui-steps	Main container element.
.ui-steps-item	Step element.
.ui-steps-name	Name of the step.
.ui-steps-item	Number of the step.

As skinning style classes are global, see the main theming section for more information. Here is an example of a styled steps having "custom" as its *styleClass*;

3.142 Sticky

Sticky component positions other components as fixed so that these components stay in window viewport during scrolling.

Info

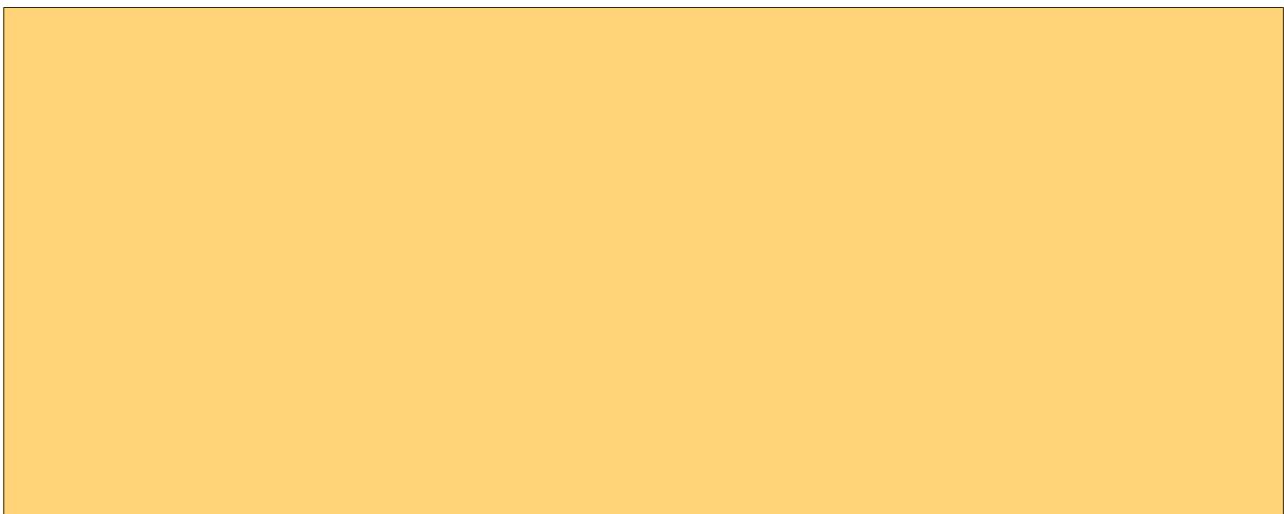

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
target	null	String	Component to make sticky.
margin	0	Integer	Margin to the top of the page during fixed scrolling.

Getting started with Sticky

Sticky requires a target to keep in viewport on scroll. Here is a sticky toolbar;

Skinning

There are no visual styles of sticky however, *ui-sticky* class is applied to the target when the position is fixed. When target is restored to its original location this is removed.

3.143 SubTable

SubTable is a helper component of datatable used for grouping.

listener	null	MethodExpr	Method expression to execute before rendering summary row. (e.g. to calculate totals).

Getting started with SummaryRow

See DataTable section for more information.

3.145 Tab

Tab is a generic container component used by other PrimeFaces components such as tabView and accordionPanel.

Info

Tag	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
title	null	Boolean	Title text of the tab
titleStyle	null	String	Inline style of the tab.
titleStyleClass	null	String	Style class of the tab.
disabled	false	Boolean	Disables tab element.
closable	false	Boolean	Makes the tab closable when enabled.
titletip	null	String	Tooltip of the tab header.

Getting started with the Tab

See the sections of components who utilize tab component for more information. As tab is a shared component, not all attributes may apply to the components that use tab.

3.146 TabMenu

TabMenu is a navigation component that displays menuitems as tabs.

Info

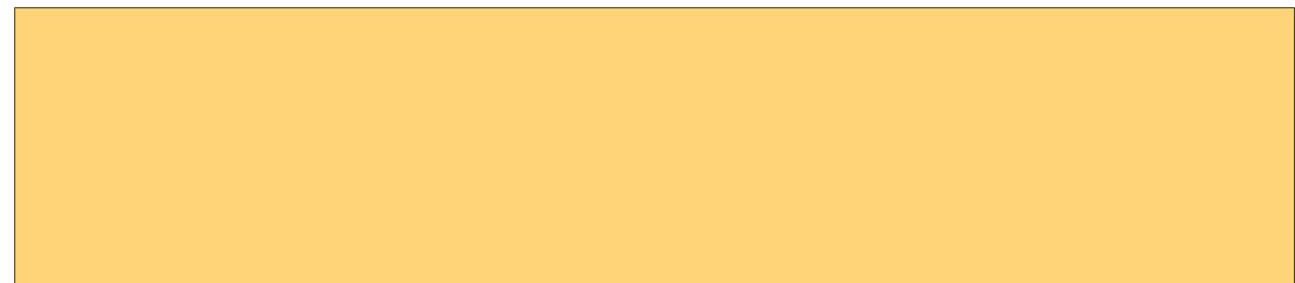

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
model	null	MenuModel	MenuModel instance to build menu dynamically.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
activeIndex	0	Integer	Index of the active tab.
widgetVar	null	String	Name of the client side widget.

Getting started with TabMenu

TabMenu requires menuitems as children components, each menuitem is rendered as a tab. Just like in any other menu component, menuitems can be utilized to do ajax requests, non-ajax requests and simple GET navigations.

Skinning TabMenu

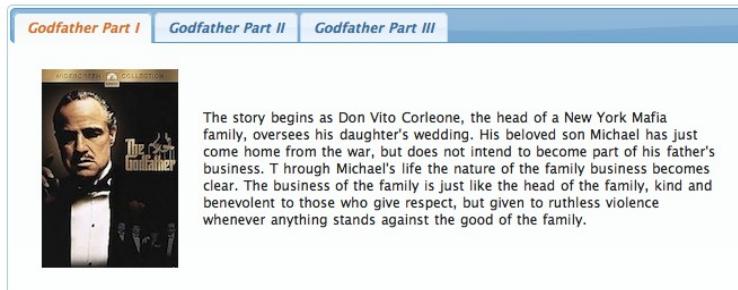

TabMenu resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

.ui-tabmenu	Main container element.
.ui-tabmenu-nav	Container for tabs.
.ui-tabmenuitem	MenuItem container.
.ui-menuitem	Anchor of a menuitem.

As skinning style classes are global, see the main theming section for more information.

3.147 TabView

TabView is a container component to group content in tabs.

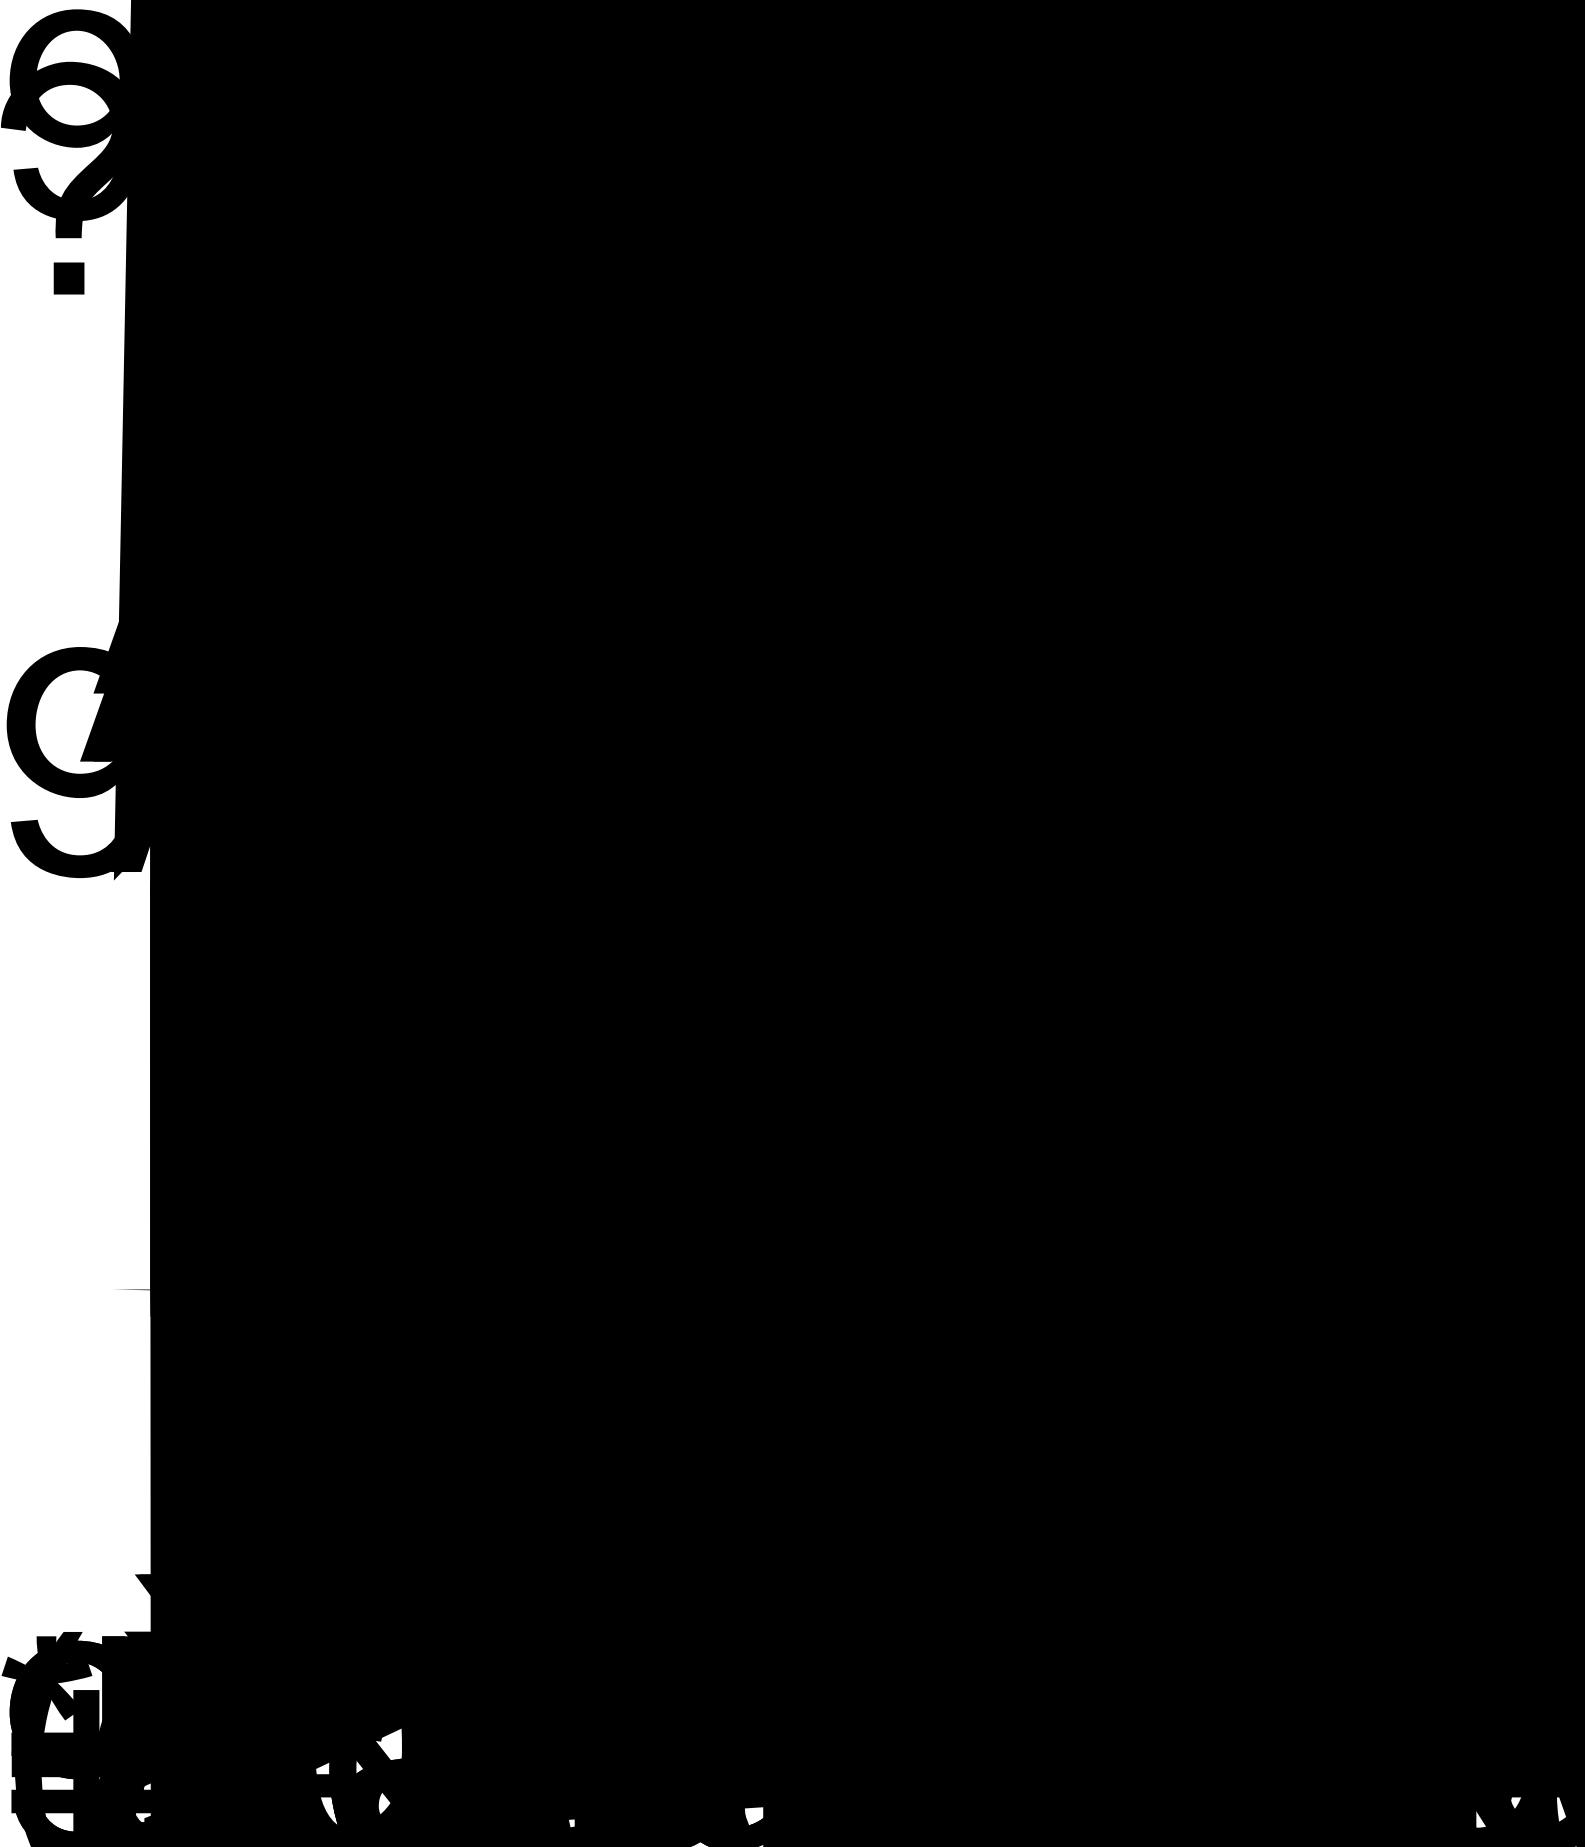

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
widgetVar	null	String	Variable name of the client side widget.
activeIndex	0	Integer	Index of the active tab.
effect	null	String	Name of the transition effect.
effectDuration	null	String	Duration of the transition effect.
dynamic	false	Boolean	Enables lazy loading of inactive tabs.
cache	true	Boolean	When tab contents are lazy loaded by ajax toggleMode, caching only retrieves the tab contents once and subsequent toggles of a cached tab does not communicate with server. If caching is turned off, tab

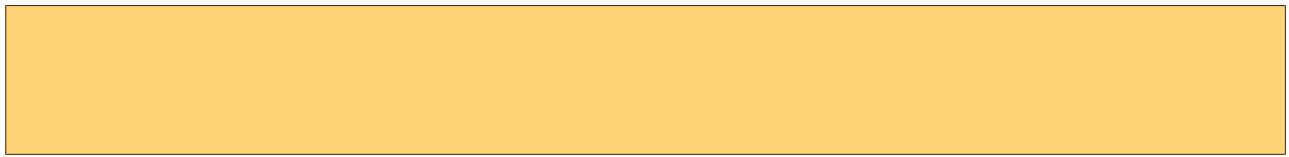

Content Caching

Dynamically loaded tabs cache their contents by default, by doing so, reactivating a tab doesn't result in an ajax request since contents are cached. If you want to reload content of a tab each time a tab is selected, turn off caching by *cache* to false.

Effects

Content transition effects are controlled with *effect* and *effectDuration* attributes. EffectDuration specifies the speed of the effect, *slow*, *normal* (default) and *fast* are the valid options.

Ajax Behavior Events

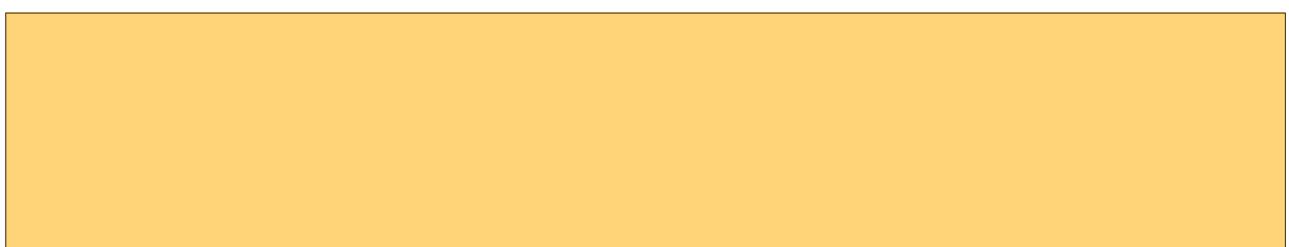

tabChange and *tabClose* are the ajax behavior events of tabview that are executed when a tab is changed and closed respectively. Here is an example of a tabChange behavior implementation;

Your listener(if defined) will be invoked with an *org.primefaces.event.TabChangeEvent* instance that contains a reference to the new active tab and the accordion panel itself. For tabClose event, listener will be passed an instance of *org.primefaces.event.TabCloseEvent*.

Dynamic Number of Tabs

When the tabs to display are not static, use the built-in iteration feature similar to ui:repeat.

Orientations

Four different orientations are available; *top*(*default*), *left*, *right* and *bottom*.

The story begins as Don Vito Corleone, the head of a New York Mafia family, oversees his daughter's wedding. His beloved son Michael has just come home from the war, but does not intend to become part of his father's business. Through Michael's life the nature of the family business becomes clear. The business of the family is just like the head of the family, kind and benevolent to those who give respect, but given to ruthless violence whenever anything stands against the good of the family.

Scrollable Tabs

Tab headers wrap to the next line in case there is not enough space at header area by default. Using scrollable feature, it is possible to keep headers aligned horizontally and use navigation buttons to access hidden headers.

Client Side Callbacks

Tabview has three callbacks for client side. *onTabChange* is executed when an inactive tab is clicked, *onTabShow* is executed when an inactive tab becomes active to be shown and *onTabClose* when a closable tab is closed. All these callbacks receive index parameter as the index of tab.

Client Side API

Widget: *PrimeFaces.widget.TabView*

select(index)	index: Index of tab to display	void	Activates tab with given index
selectTab(index)	index: Index of tab to display	void	(Deprecated, use select instead) Activates tab with given index
disable(index)	index: Index of tab to disable	void	Disables tab with given index
enable(index)	index: Index of tab to enable	void	Enables tab with given index
remove(index)	index: Index of tab to remove	void	Removes tab with given index
getLength()	-	Number	Returns the number of tabs
getActiveIndex()	-	Number	Returns index of current tab

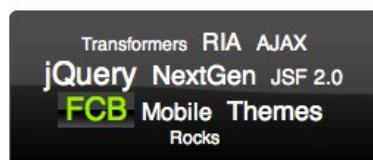

Skinning

As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes.

.ui-tabs	Main tabview container element
.ui-tabs- {orientation}	Orientation specific (top, bottom, right, left) container.
.ui-tabs-nav	Main container of tab headers
.ui-tabs-panel	Each tab container
.ui-tabs-scrollable	Container element of a scrollable tabview.

3.148 TagCloud

TagCloud displays a collection of tag with different strengths.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
model	null	TagCloudModel	Backing tag cloud model.
style	null	String	Inline style of the container element.
styleClass	null	String	Style class of the container element.

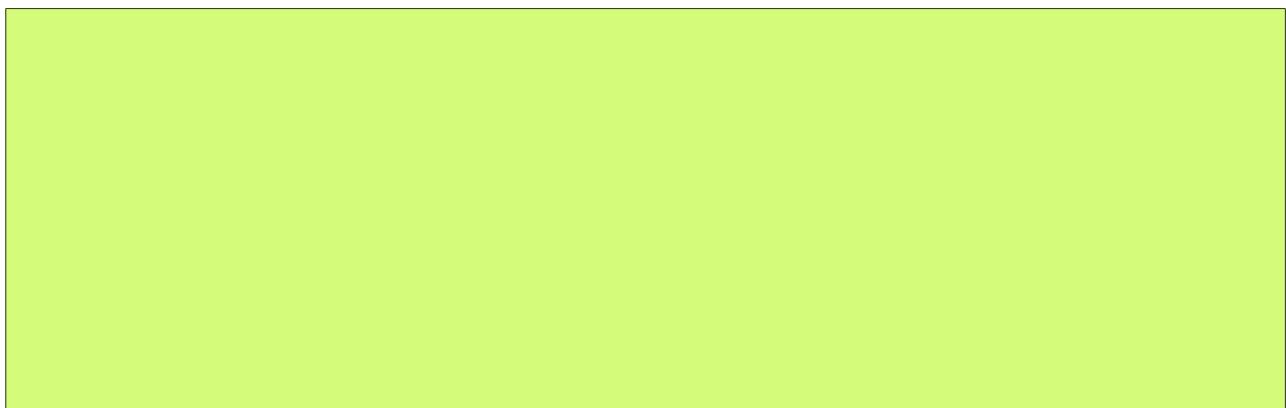

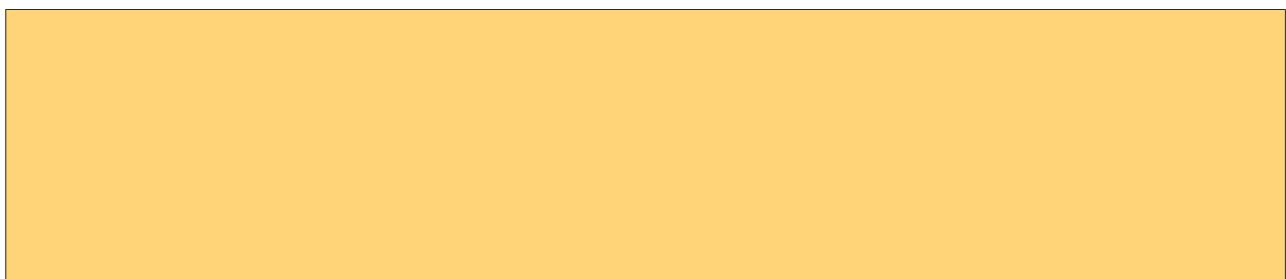

Getting started with the TagCloud

TagCloud requires a backend TagCloud model to display.

Selecting Tags

An item in tagCloud can be selected using *select* ajax behavior. Note that only items with null urls can be selected.

TagCloud API

org.primefaces.model.tagcloud.TagCloudModel

List<TagCloudItem> getTags()	Returns all tags in model.
void addTag(TagCloudItem item)	Adds a tag.
void removeTag(TagCloudItem item)	Removes a tag.
void clear()	Removes all tags.

PrimeFaces provides *org.primefaces.model.tagcloud.DefaultTagCloudModel* as the default implementation.

org.primefaces.model.tagcloud.TagCloudItem

String getLabel()	Returns label of the tag.
String getUrl()	Returns url of the tag.
int getStrength()	Returns strength of the tag between 1 and 5.

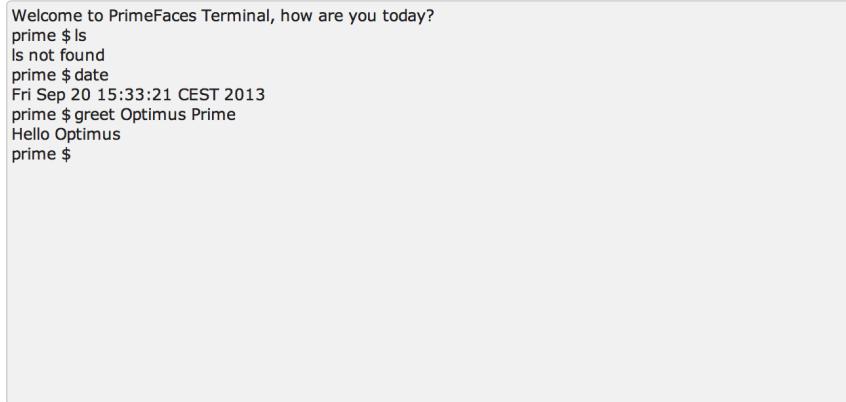

org.primefaces.model.tagcloud.DefaultTagCloudItem is provided as the default implementation.

Skinning

TagCloud resides in a container element that *style* and *styleClass* attributes apply. *.ui-tagcloud* applies to main container and *.ui-tagcloud-strength-[1,5]* applies to each tag. As skinning style classes are global, see the main theming section for more information.

3.149 Terminal

Terminal is an ajax powered web based terminal that brings desktop terminals to JSF.

Info

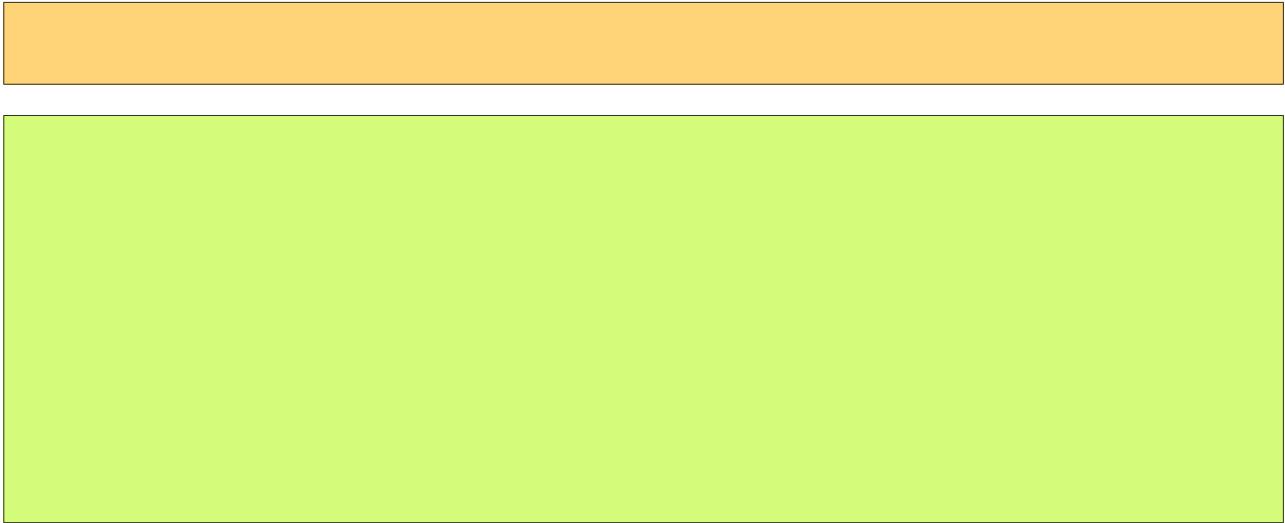

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
welcomeMessage	null	String	Welcome message to be displayed on initial load.
prompt	prime \$	String	Primary prompt text.
commandHandler	null	MethodExpr	Method to be called with arguments to process.
widgetVar	null	String	Name of the client side widget.

Getting started with the Terminal

A command handler is required to interpret commands entered in terminal.

Whenever a command is sent to the server, `handleCommand` method is invoked with the command name and the command arguments as a String array.

Client Side API

Client side widget exposes `clear()` and `focus()` methods. Following shows how to add focus on a terminal nested inside a dialog;

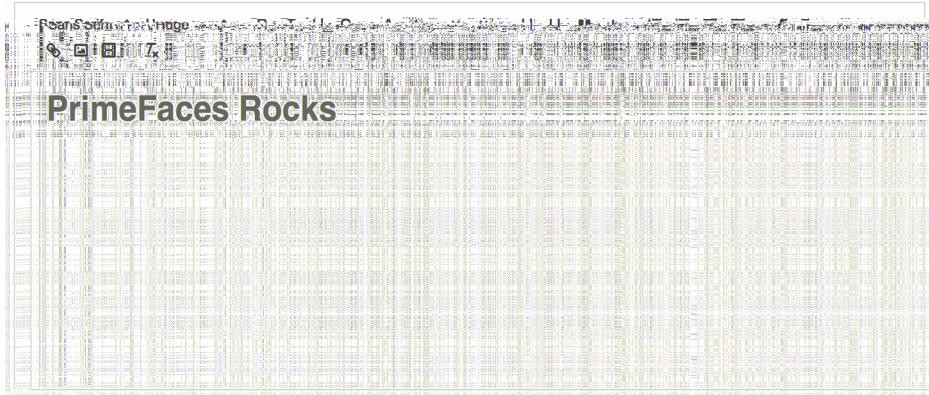

Skinning

Terminal resides in a main container which `style` and `styleClass` attributes apply. Following is the list of structural style classes;

.ui-terminal	Main container element.
.ui-terminal-content	Content display of previous commands with responses.
.ui-terminal-prompt	Prompt text.

3.150 TextEditor

Editor is an input component with rich text editing capabilities based on Quill.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean.
value	null	Object	Value of the component than can be either an EL expression or a literal text.
converter	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id.
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required.

validator	null	Method Expr	A method expression that refers to a method validating the input.
valueChangeListener	null	Method Expr	A method expression that refers to a method for handling a valuechangeevent.
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fails.
widgetVar	null	String	Name of the client side widget.
height	null	Integer	Height of the editor.
readonly	false	Boolean	Whether to instantiate the editor to read-only mode.
style	null	String	Inline style of the editor container.
styleClass	null	String	Style class of the editor container.
placeholder	null	String	Placeholder text to show when editor is empty

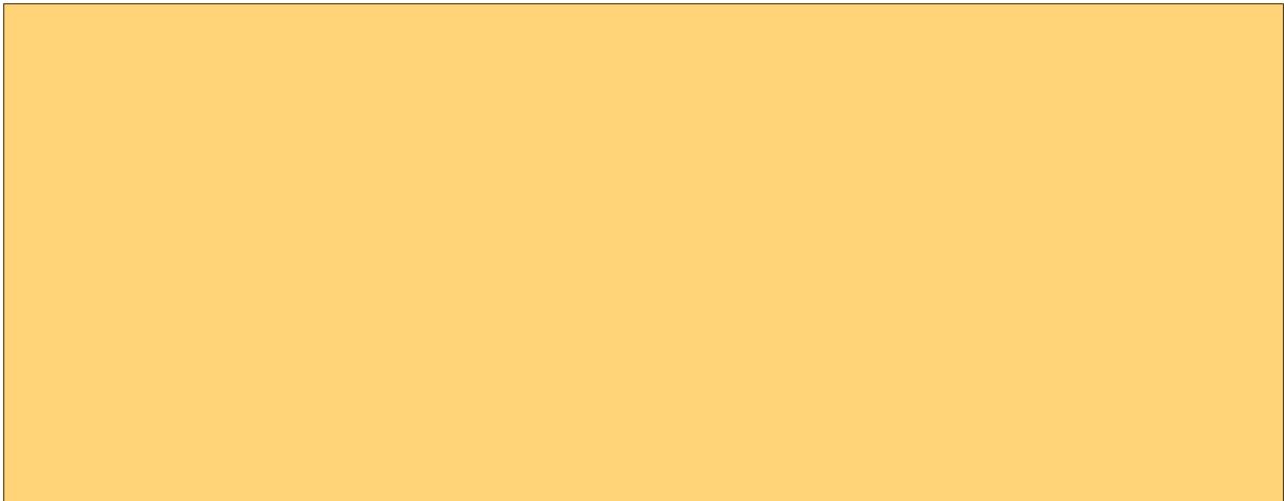

Getting started with the Editor

Rich Text entered using the Editor is passed to the server using *value* expression.

Custom Toolbar

Toolbar of editor is easy to customize using *toolbar facet*;

Refer to QuillJS documentation for available list of formats.

Client Side API

Widget: *PrimeFaces.widget.Editor*

getEditorValue()	-	void	Initializes a lazy editor, subsequent calls do not reinit the editor.
clear()	-	void	Clears the text in editor.

Skinning

Refer to QuillJS documentation for styling;

<https://quilljs.com/guides/how-to-customize-quill/>

3.151 ThemeSwitcher

ThemeSwitcher enables switching PrimeFaces themes on the fly with no page refresh.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
effect	fade	String	Name of the animation.
effectSpeed	normal	String	Duration of the toggle animation, valid values are "slow", "normal" and "fast".
disabled	false	Boolean	Disables the component.
label	null	String	User presentable name.
onchange	null	String	Client side callback to execute on theme change.
style	null	String	Inline style of the component.

styleClass	null	String	Style class of the component.
var	null	String	Variable name to refer to each item.
height	null	Integer	Height of the panel.
tabindex	null	Integer	Position of the element in the tabbing order.

Getting Started with the ThemeSwitcher

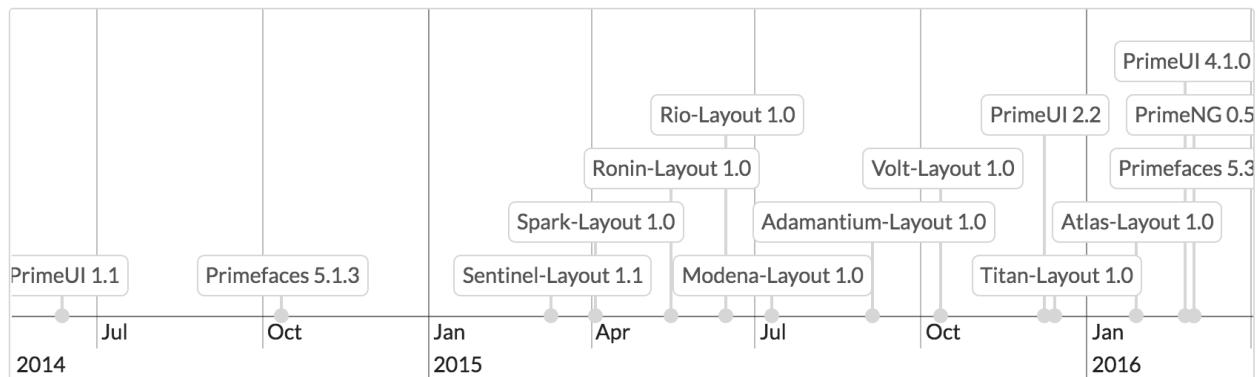

ThemeSwitcher usage is very similar to selectOneMenu.

Stateful ThemeSwitcher

By default, themeswitcher just changes the theme on the fly with no page refresh, in case you'd like to get notified when a user changes the theme (e.g. to update user preferences), you can use an ajax

3.152 TimeLine

Timeline is an interactive graph to visualize events in time.

Info

Tag	timeLine
Component Class	org.primefaces.component.timeline.TimeLine
Component Type	org.primefaces.component.TimeLine
Component Family	org.primefaces.component
Renderer Type	org.primefaces.component.TimeLineRenderer
Renderer Class	org.primefaces.component.timeline.TimeLineRenderer

Attributes

Name	Default	Type	Description
id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
style	null	String	Inline style of the component.

Name	Default	Type	Description
styleClass	null	String	Style class of the component.
var	null	String	Name of the request-scoped variable for underlaying object in the TimelineEvent for each iteration.
value	null	Timeline Model	An instance of TimelineModel representing the backing model.
varGroup	null	String	Name of the request-scoped variable for underlaying object in the TimelineGroup for each iteration.
locale	null	Object	User locale for i18n messages. The attribute can be either a String or Locale object.
timeZone	null	Object	Target time zone to convert start / end dates for displaying. This time zone is the time zone the user would like to see dates in UI. The attribute can be either a String or TimeZone object or null. If null, timeZone defaults to the server's time zone the application is running in.
browserTimeZone	null	Object	Time zone the user's browser / PC is running in. This time zone allows to correct the conversion of start / end dates to the target timeZone for displaying. The attribute can be either a String or TimeZone object or null. Note: browserTimeZone should be provided if the target timeZone is provided. If null, browserTimeZone defaults to the server's timeZone.
height	auto	auto	The height of the timeline in pixels, as a percentage, or "auto". When the height is set to "auto", the height of the timeline is automatically adjusted to fit the contents. If not, it is possible that events get stacked so high, that they are not visible in the timeline. When height is set to "auto", a minimum height can be specified with the option minHeight. Default is "auto".
minHeight	0	Integer	Specifies a minimum height for the Timeline in pixels. Useful when height is set to "auto".
width	100%	String	The width of the timeline in pixels or as a percentage.
responsive	true	Boolean	Check if the timeline container is resized, and if so, resize the timeline. Useful when the webpage (browser window) or a layout pane / unit containing

Name	Default	Type	Description
			the timeline component is resized.
axisOnTop	false	Boolean	If false, the horizontal axis is drawn at the bottom. If true, the axis is drawn on top.
dragAreaWidth	10	Integer	The width of the drag areas in pixels. When an event with date range is selected, it has a drag area on the left and right side, with which the start or end dates of the event can be manipulated.
editable	false	Boolean	If true, the events can be edited, changed, created and deleted. Events can only be editable when the option selectable is true (default). When editable is true, the timeline can fire AJAX events "change", "edit", "add", "delete", "drop". This global setting "editable" can be overwritten for individual events by setting a value in field "editable".
selectable	true	Boolean	If true, events on the timeline are selectable. Selectable events can fire AJAX "select" events.
unselectable	true	Boolean	If true, you can unselect an item by clicking in the empty space of the timeline. If false, you cannot unselect an item, there will be always one item selected.
zoomable	true	Boolean	If true, the timeline is zoomable. When the timeline is zoomed, AJAX "rangechange" events are fired.
moveable	true	Boolean	If true, the timeline is movable. When the timeline is moved, AJAX "rangechange" events are fired.
start	null	Date	The initial start date for the axis of the timeline. If not provided, the earliest date present in the events is taken as start date.
end	null	Date	The initial end date for the axis of the timeline. If not provided, the latest date present in the events is taken as end date.
min	null	Date	Set a minimum Date for the visible range. It will not be possible to move beyond this minimum.
max	null	Date	Set a maximum Date for the visible range. It will not be possible to move beyond this maximum.
zoomMin	10L	Long	Set a minimum zoom interval for the visible range in

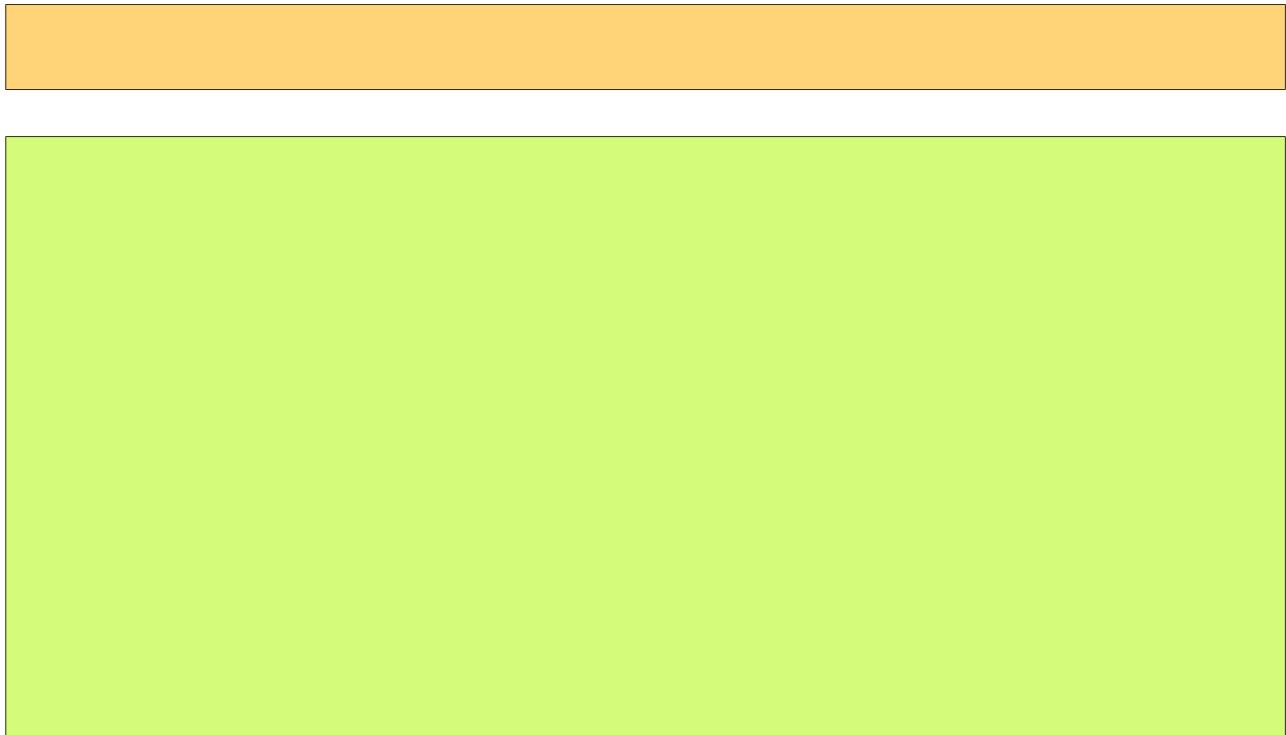

Name	Default	Type	Description
			milliseconds. It will not be possible to zoom in further than this minimum.
zoomMax	315360000000000L	Long	Set a maximum zoom interval for the visible range in milliseconds. It will not be possible to zoom out further than this maximum. Default value equals 315360000000000 ms (about 10000 years).
preloadFactor	0.0f	Float	Preload factor is a positive float value or 0 which can be used for lazy loading of events. When the lazy loading feature is active, the calculated time range for preloading will be multiplied by the preload factor. The result of this multiplication specifies the additional time range which will be considered for the preloading during moving / zooming too. For example, if the calculated time range for preloading is 5 days and the preload factor is 0.2, the result is $5 * 0.2 = 1$ day. That means, 1 day backwards and / or 1 day onwards will be added to the original calculated time range. The event's area to be preloaded is wider then. This helps to avoid frequently, time-consuming fetching of events. Default value is 0.
eventMargin	10	Integer	The minimal margin in pixels between events.
eventMarginAxis	10	Integer	The minimal margin in pixels between events and the horizontal axis.
eventStyle	box	String	Specifies the style for the timeline events. Choose from "dot" or "box".
groupsChangeable	true	Boolean	If true, items can be moved from one group to another. Only applicable when groups are used.
groupsOnRight	false	Boolean	If false, the groups legend is drawn at the left side of the timeline. If true, the groups legend is drawn on the right side.
groupsOrder	true	Boolean	Allows to customize the way groups are ordered. When true (default), groups will be ordered by content alphabetically (when the list of groups is missing) or by native ordering of TimelineGroup object in the list of groups (when the list of groups is available). When false, groups will not be ordered at all.
groupsWidth	null	String	By default, the width of the groups legend is

Name	Default	Type	Description
			adjusted to the group names. A fixed width can be set for the groups legend by specifying the "groupsWidth" as a string, for example "200px".
groupMinHeight	0	Integer	The minimum height of each individual group even if they have no items. The group height is set as the greatest value between items height and the groupMinHeight. Default is 0.
snapEvents	true	Boolean	If true, the start and end of an event will be snapped nice integer values when moving or resizing the event. Default is true.
stackEvents	true	Boolean	If true, the start and end of an event will be snapped nice integer values when moving or resizing the event.
showCurrentTime	true	Boolean	If true, the timeline shows a red, vertical line displaying the current time.
showMajorLabels	true	Boolean	By default, the timeline shows both minor and major date labels on the horizontal axis. For example the minor labels show minutes and the major labels show hours. When "showMajorLabels" is false, no major labels are shown.
showMinorLabels	true	Boolean	By default, the timeline shows both minor and major date labels on the horizontal axis. For example the minor labels show minutes and the major labels show hours. When "showMinorLabels" is false, no minor labels are shown. When both "showMajorLabels" and "showMinorLabels" are false, no horizontal axis will be visible.
showButtonNew	false	Boolean	Show the button "Create new event" in the a navigation menu.
showNavigation	false	Boolean	Show a navigation menu with buttons to move and zoom the timeline.
timeChangeable	true	Boolean	If false, items can not be moved or dragged horizontally (neither start time nor end time is changable). This is useful when items should be editable but can only be changed regarding group or content (typical use case: scheduling events).

Name	Default	Type	Description
dropHoverStyleClass	null	String	Style class to apply when an acceptable draggable is dragged over.
dropActiveStyleClass	null	String	Style class to apply when an acceptable draggable is being dragged over.
dropAccept	null	String	Selector to define the accepted draggables.
dropScope	null	String	Scope key to match draggables and droppables.
animate	true	Boolean	When true, events are moved animated when resizing or moving them. This is very pleasing for the eye, but does require more computational power.
animateZoom	true	Boolean	When true, events are moved animated when zooming the Timeline. This looks cool, but does require more computational power.

Getting started with the TimeLine

TimeLine requires a value of `org.primefaces.model.timeline.TimelineModel` type. An event should be an instance of `org.primefaces.model.timeline.TimelineEvent` and included in model via add method.

Examples

For examples on editing, grouping, styling, ranges, linked timelines and lazy loading please visit;

Ajax Behavior Events

Event	Listener Parameter	Fired
page	org.primefaces.event.data.PageEvent	On pagination.
sort	org.primefaces.event.data.SortEvent	When a column is sorted.
add	TimelineAddEvent	On event add.
change	TimelineModificationEvent	On event change.
changed	TimelineModificationEvent	On event change complete.
edit	TimelineModificationEvent	On event edit.
delete	TimelineModificationEvent	On event delete.
select	TimelineSelectEvent	On event select.
rangechange	TimelineRangeEvent	On range change.
rangechanged	TimelineRangeEvent	On range change complete.
lazyload	TimelineLazyLoadEvent	On lazy load.
drop	TimelineDragDropEvent	On drop from outside.

* All events are under org.primefaces.event.timeline.* package.

3.153 TieredMenu

TieredMenu is used to display nested submenus with overlays.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

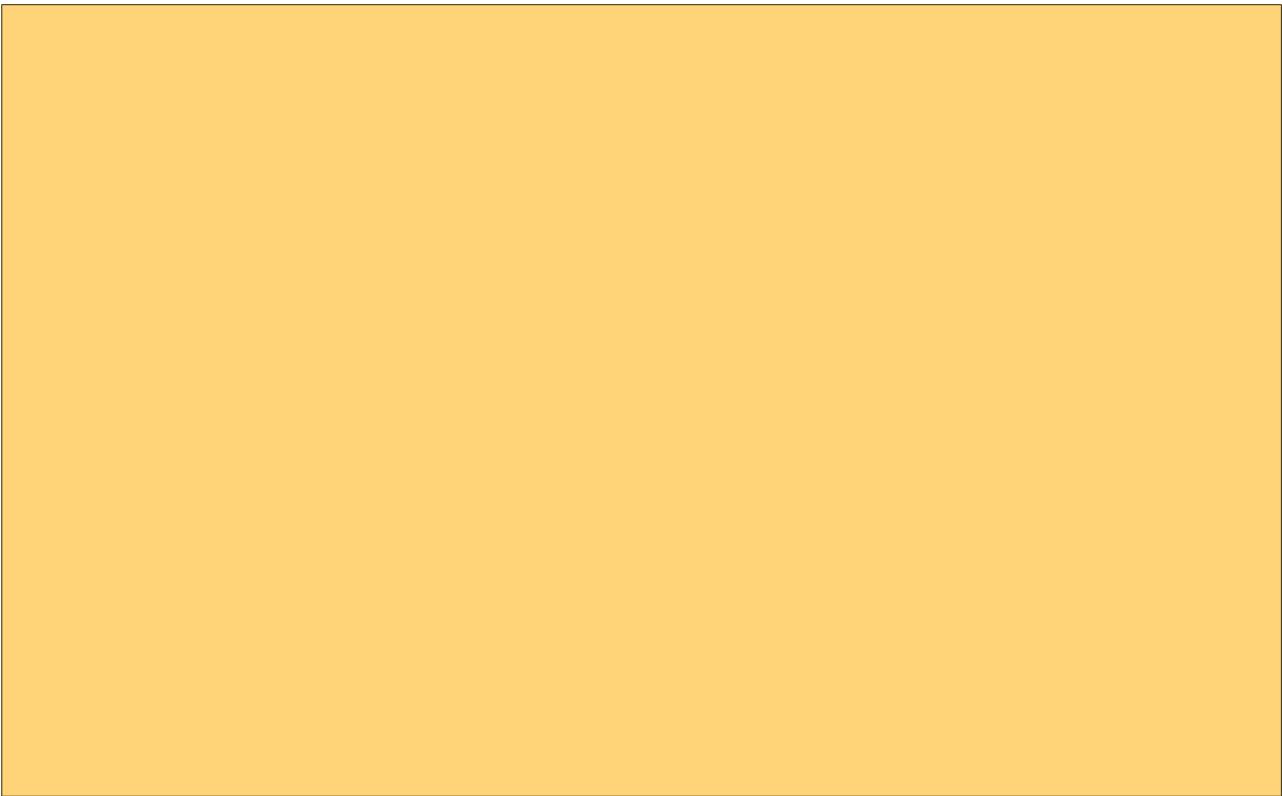

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
widgetVar	null	String	Name of the client side widget.
model	null	MenuModel	MenuModel instance for programmatic menu.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
autoDisplay	true	Boolean	Defines whether the first level of submenus will be displayed on mouseover or not. When set to false, click event is required to display.
trigger	null	String	Id of the component whose triggerEvent will show the dynamic positioned menu.
my	null	String	Corner of menu to align with trigger element.
at	null	String	Corner of trigger to align with menu element.

overlay	false	Boolean	Defines positioning, when enabled menu is displayed with absolute position relative to the trigger. Default is false, meaning static positioning.
triggerEvent	click	String	Event name of trigger that will show the dynamic positioned menu.
toggleEvent	hover	String	Event to toggle the submenus, valid values are "hover" and "click".

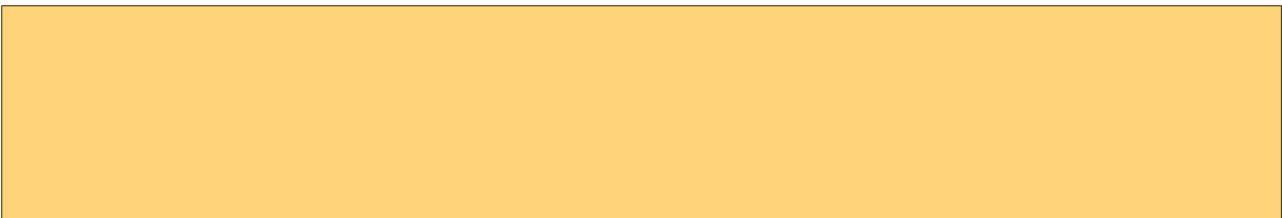

Getting started with the TieredMenu

TieredMenu consists of submenus and menuitems, submenus can be nested and each nested submenu will be displayed in an overlay.

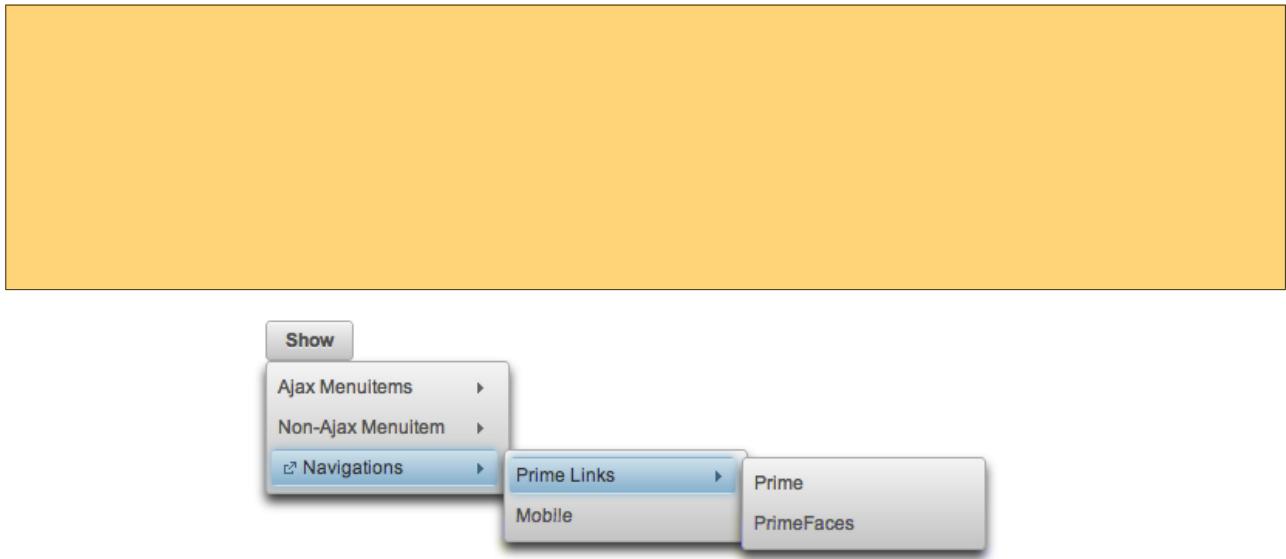

AutoDisplay

By default, submenus are displayed when mouse is over root menuitems, set autoDisplay to false to require a click on root menuitems to enable autoDisplay mode.

Overlay

TieredMenu can be positioned relative to a trigger component, following sample attaches a tieredMenu to the button so that whenever the button is clicked tieredMenu will be displayed in an overlay itself.

Client Side API

Widget: `PrimeFaces.widget.TieredMenu`

<code>show()</code>	-	<code>void</code>	Shows overlay menu.
<code>hide()</code>	-	<code>void</code>	Hides overlay menu.
<code>align()</code>	-	<code>void</code>	Aligns overlay menu with trigger.

Skinning

TieredMenu resides in a main container which *style* and *styleClass* attributes apply. Following is the list of structural style classes;

<code>.ui-menu .ui-tieredmenu</code>	Container element of menu.
<code>.ui-menu-list</code>	List container
<code>.ui-menuitem</code>	Each menu item
<code>.ui-menuitem-link</code>	Anchor element in a link item
<code>.ui-menuitem-text</code>	Text element in an item

As skinning style classes are global, see the main theming section for more information.

3.154 Toolbar

Toolbar is a horizontal grouping component for commands and other content.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

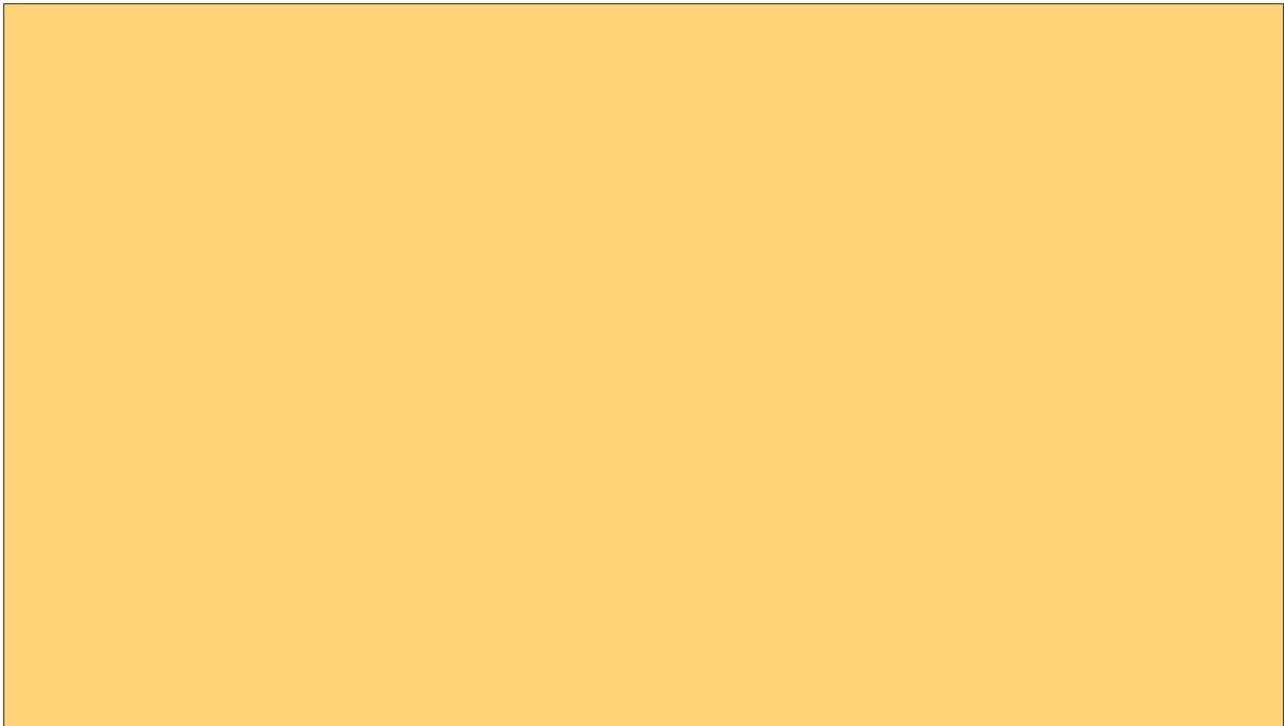

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
style	null	String	Inline style of the container element.
styleClass	null	String	Style class of the container element.

Getting Started with the Toolbar

Toolbar has two placeholders(left and right) that are defined with facets. You can also use toolbarGroup as an alternative to facets.

Any content can be placed inside toolbar.

Skinning

Toolbar resides in a container element which *style* and *styleClass* options apply. Following is the list of structural style classes;

.ui-toolbar	Main container
.ui-toolbar .ui-separator	Divider in a toolbar
.ui-toolbar-group-left	Left toolbarGroup container
.ui-toolbar-group-right	Right toolbarGroup container

As skinning style classes are global, see the main theming section for more information.

3.155 ToolbarGroup

ToolbarGroup is a helper component for Toolbar component to define placeholders.

Info

Tag	
Component Class	
Component Type	
Component Family	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
align	null	String	Defines the alignment within toolbar, valid values are <i>left</i> and <i>right</i> .
style	null	String	Inline style of the container element.
styleClass	null	String	Style class of the container element.

Getting Started with the ToolbarGroup

See toolbar documentation for more information about how Toolbar Group is used.

3.156 Tooltip

Tooltip goes beyond the legacy html title attribute by providing custom effects, events, html content and advance theme support.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component than can be either an EL expression of a literal text
converter	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
widgetVar	null	String	Name of the client side widget.
showEvent	mouseover	String	Event displaying the tooltip.
showEffect	fade	String	Effect to be used for displaying.
hideEvent	mouseout	String	Event hiding the tooltip.
hideEffect	fade	String	Effect to be used for hiding.
showDelay	150	Integer	Delay time to show tooltip in milliseconds.

hideDelay	0	Integer	Delay time to hide tooltip in milliseconds.
for	null	String	Component to attach the tooltip.
style	null	String	Inline style of the tooltip.
styleClass	null	String	Style class of the tooltip.
globalSelector	null	String	jquery selector for global tooltip, defaults to "a,:input,:button".
escape	true	Boolean	Defines whether html would be escaped or not.
trackMouse	false	Boolean	Tooltip position follows pointer on mousemove.
beforeShow	null	String	Client side callback to execute before tooltip is shown. Returning false will prevent display.
onHide	null	String	Client side callback to execute after tooltip is shown.
onShow	null	String	Client side callback to execute after tooltip is shown.
position	right	String	Position of the tooltip, valid values are right, left, top and bottom.

Getting started with the Tooltip

Tooltip can be used by attaching it to a target component. Tooltip value can also be retrieved from target's title, so following are same;

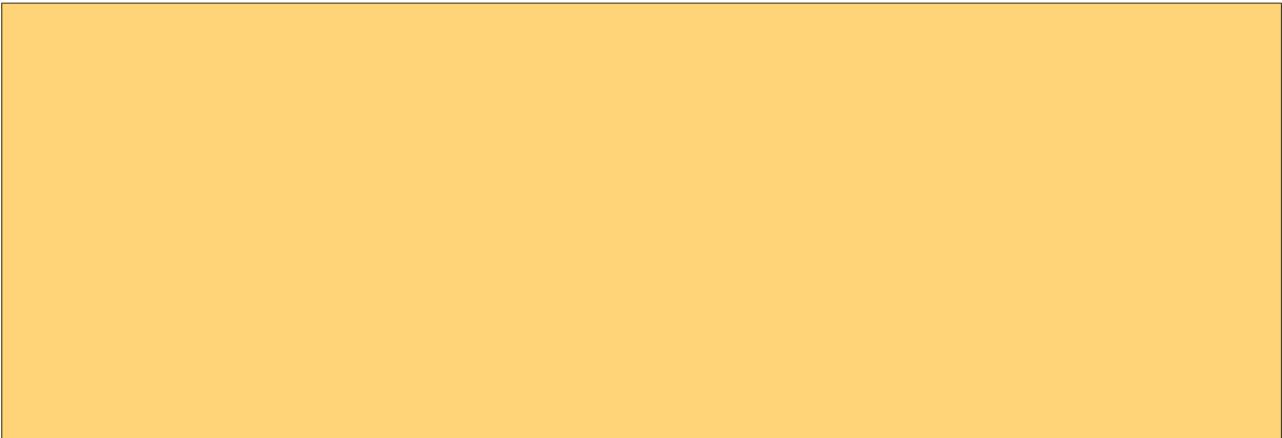

Global Tooltip

Global tooltip binds to elements with title attributes. Ajax updates are supported as well, meaning if target component is updated with ajax, tooltip can still bind. As global tooltips are more efficient since only one instance of tooltip is used across all tooltip targets, it is suggested to be used instead of explicit tooltips unless you have a custom case e.g. different options, custom content.

IE10 Issue

Due to a bug, IE10 always displays the title text in a native popup when the element receives focus via tabbing and two tooltips might be displayed at once. Solution is to use passthrough data-tooltip attribute instead of title.

Position

Tooltip has four possible position, default is *right* and other valid values are *left*, *top* and *bottom*.

Events and Effects

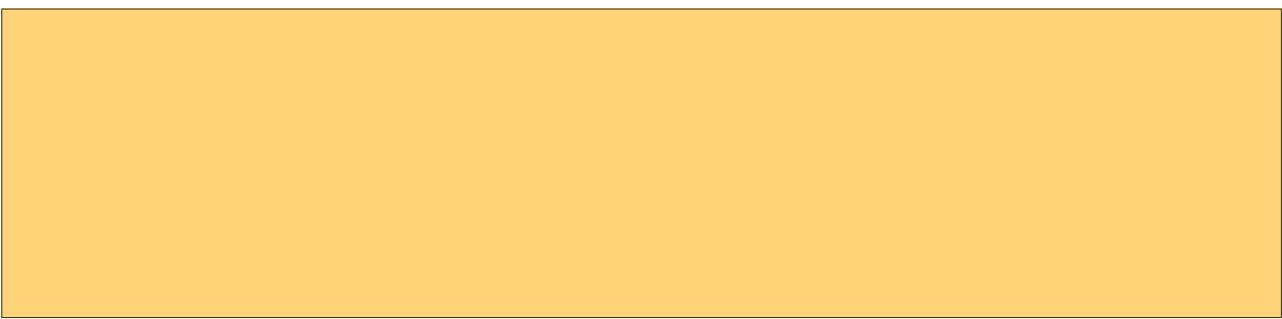

A tooltip is shown on mouseover event and hidden when mouse is out by default. If you need to change this behavior use the showEvent and hideEvent feature. Tooltip below is displayed when the input gets the focus and hidden with onblur.

Available options for effects are; *blind*, *bounce*, *clip*, *drop*, *explode*, *fold*, *highlight*, *puff*, *pulsate*, *scale*, *shake*, *size* and *slide*.

Html Content

Another powerful feature of tooltip is the ability to display custom content as a tooltip.

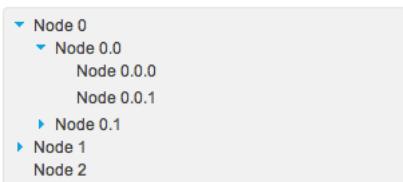

Skinning

Tooltip has only *.ui-tooltip* as a style class and is styled with global skinning selectors, see main skinning section for more information.

3.157 Tree

Tree is used for displaying hierarchical data and creating site navigations.

Info

Tag	Q
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

style	null	String	Style of the main container element of tree
styleClass	null	String	Style class of the main container element of tree
selectionMode	null	String	Defines the selectionMode
highlight	true	Boolean	Highlights nodes on hover when selection is enabled.
datakey	null	Object	Unique key of the data presented by nodes.
animate	false	Boolean	When enabled, displays slide effect on toggle.
orientation	vertical	String	Orientation of layout, <i>vertical</i> or <i>horizontal</i> .
propagateSelectionUp	true	Boolean	Defines upwards selection propagation for checkbox mode.
propagateSelectionDown	true	Boolean	Defines downwards selection propagation for checkbox mode.
dir	ltr	String	Defines text direction, valid values are <i>ltr</i> and <i>rtl</i> .
draggable	false	Boolean	Makes tree nodes draggable.
droppable	false	Boolean	Makes tree droppable.
dragdropScope	null	String	Scope key to group a set of tree components for transferring nodes using drag and drop.
dragMode	self	String	Defines parent-child relationship when a node is dragged, valid values are self (default), parent and ancestor.
dropRestrict	none	String	Defines parent-child restrictions when a node is dropped valid values are none (default) and sibling.
required	false	Boolean	Validation constraint for selection.
requiredMessage	null	String	Message for required selection validation.
skipChildren	false	Boolean	Ignores processing of children during lifecycle, improves performance if table only has output components.
showUnselectableCheckbox	false	Boolean	Defines if in checkbox selection mode, a readonly checkbox should be displayed for an unselectable node.
tabindex	0	String	Position of the element in the tabbing order.
nodeVar	null	String	Name of the request-scoped variable that'll be used to refer current treenode using EL.
filterBy	null	Object	Value expression to be used in filtering.
filterMatchMode	startsWith	String	Match mode for filtering.

Getting started with the Tree

Tree is populated with a *org.primefaces.model.TreeNode* instance which corresponds to the root.

TreeNode vs p:TreeNode

TreeNode API is used to create the node model and consists of *org.primefaces.model.TreeNode* instances, on the other hand `<p:treeNode />` represents a component of type *org.primefaces.component.tree.UITreeNode*. You can bind a TreeNode to a particular p:treeNode using the *type* name. Document Tree example in upcoming section demonstrates a sample usage.

TreeNode API

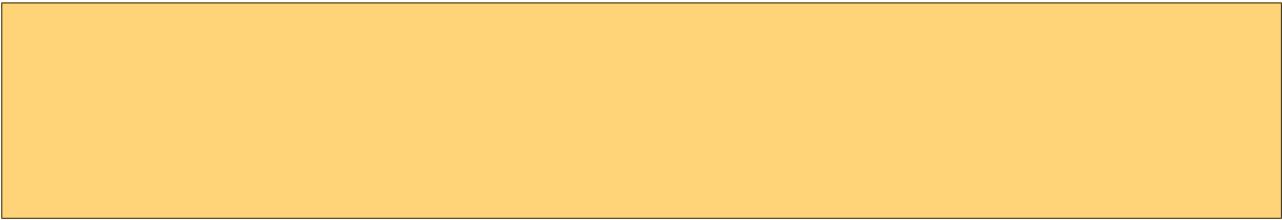

TreeNode has a simple API to use when building the backing model. For example if you call `node.setExpanded(true)` on a particular node, tree will render that node as expanded.

type	String	type of the treeNode name, default type name is "default".
data	Object	Encapsulated data

children	List<TreeNode>	List of child nodes
parent	TreeNode	Parent node
expanded	Boolean	Flag indicating whether the node is expanded or not

Dynamic Tree

Tree is non-dynamic by default and toggling happens on client-side. In order to enable ajax toggling set dynamic setting to true.

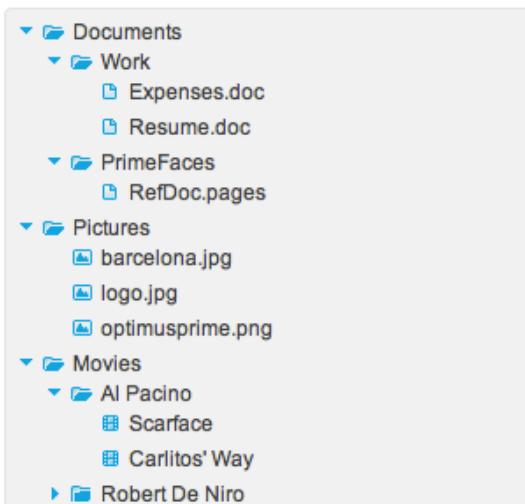

Non-Dynamic: When toggling is set to client all the treenodes in model are rendered to the client and tree is created, this mode is suitable for relatively small datasets and provides fast user interaction. On the otherhand it's not suitable for large data since all the data is sent to the client also client side tree is stateless.

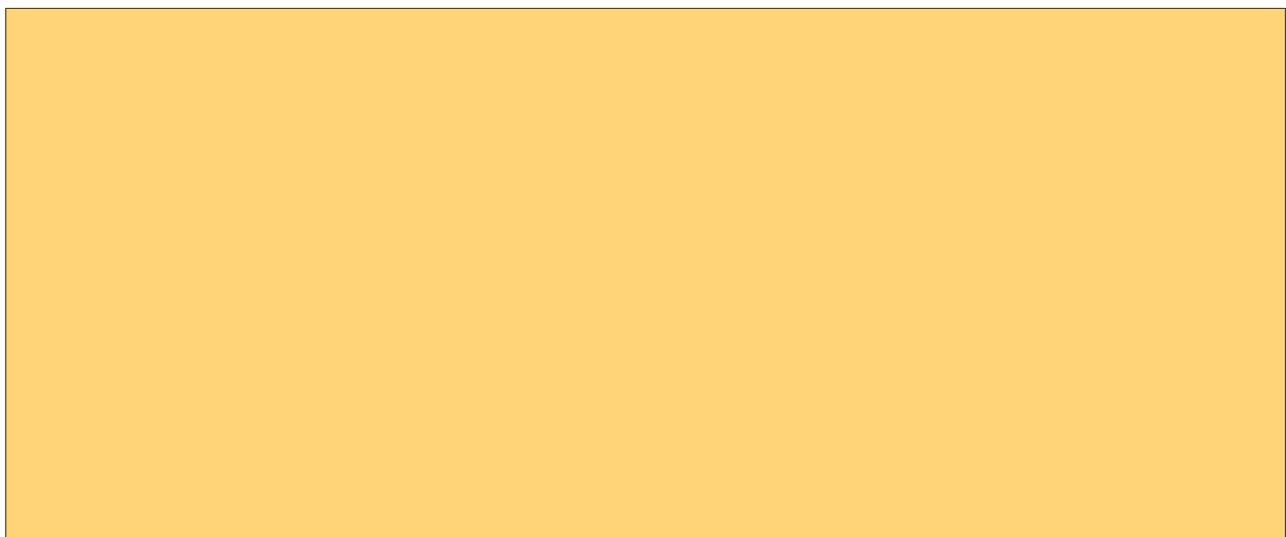

Dynamic: Dynamic mode uses ajax to fetch the treenodes from server side on demand, compared to the client toggling, dynamic mode has the advantage of dealing with large data because only the child nodes of the root node is sent to the client initially and whole tree is lazily populated. When a node is expanded, tree only loads the children of the particular expanded node and send to the client for display.

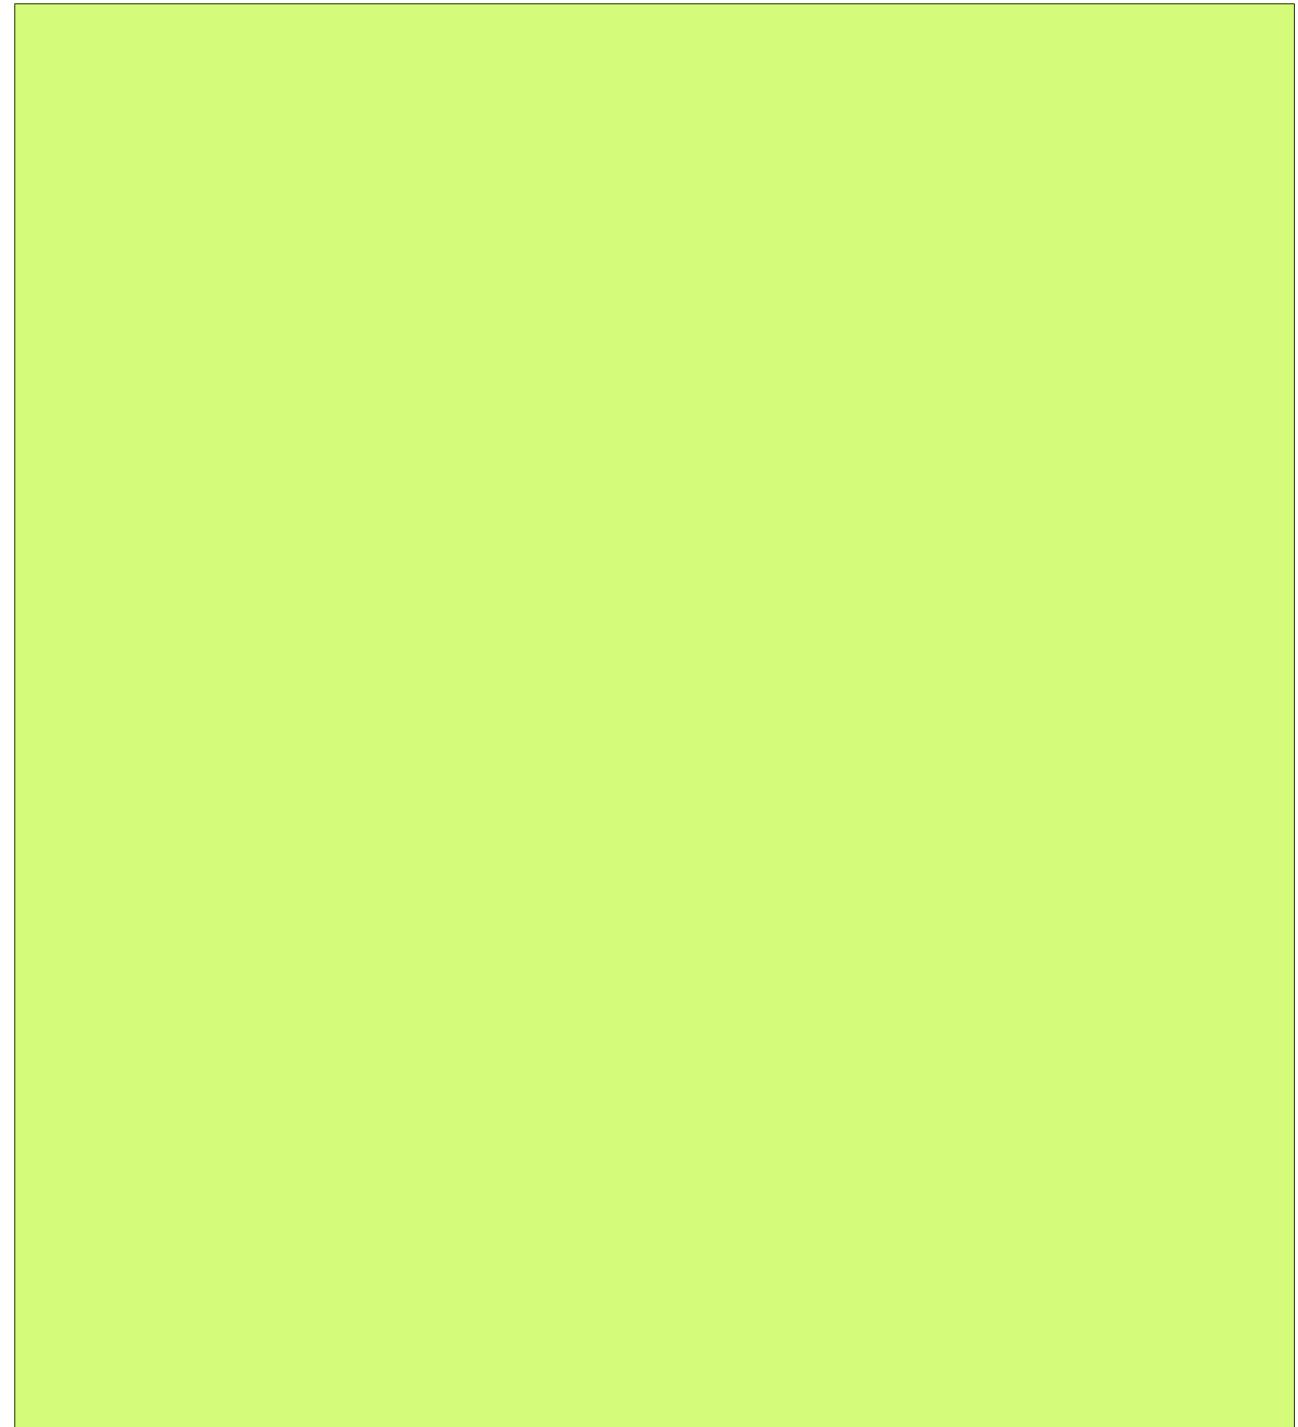

Multiple TreeNode Types

It's a common requirement to display different TreeNode types with a different UI (eg icon). Suppose you're using tree to visualize a company with different departments and different employees, or a document tree with various folders, files each having a different formats (music, video). In order to solve this, you can place more than one `<p:treeNode />` components each having a different type and use that "type" to bind TreeNode's in your model. Following example demonstrates a document explorer. Here is the final output to achieve;

Document Explorer is implemented with four different *<p:treeNode />* components and additional CSS skinning to visualize expanded/closed folder icons.

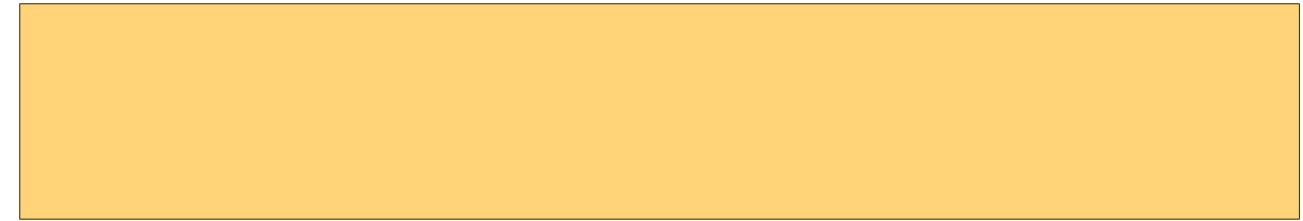

Integration between a TreeNode and a p:treeNode is the type attribute, for example music files in document explorer are represented using TreeNodes with type "mp3", there's also a p:treeNode component with same type "mp3". This results in rendering all music nodes using that particular p:treeNode representation which displays a note icon. Similarly document and pictures have their own p:treeNode representations.

Folders on the other hand have two states whose icons are defined by *expandedIcon* and *collapsedIcon* attributes.

Filtering

Tree has built-in support for filtering that is enabled by using filterBy property.

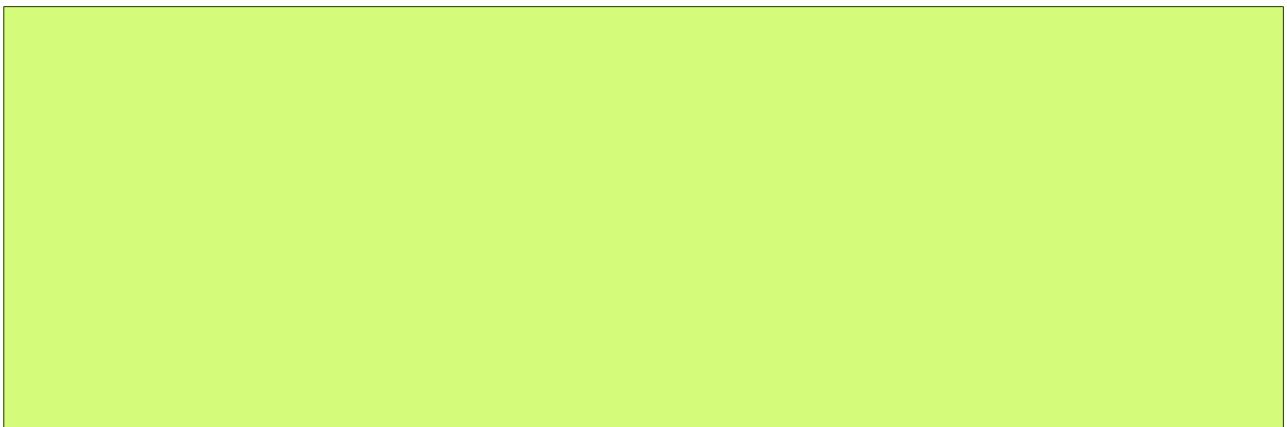

`startsWith` is the default filter method and `filterMatchMode` is used to customize this. Valid values are `startsWith`, `endsWith`, `contains`, `exact`, `lt`, `lte`, `gt`, `gte`, `equals` and `in`.

Ajax Behavior Events

Tree provides various ajax behavior events.

expand	org.primefaces.event.NodeExpandEvent	When a node is expanded.
collapse	org.primefaces.event.NodeCollapseEvent	When a node is collapsed.
select	org.primefaces.event.NodeSelectEvent	When a node is selected.
unselect	org.primefaces.event.NodeUnselectEvent	When a node is unselected.

Following tree has three listeners;

Event listeners are also useful when dealing with huge amount of data. The idea for implementing such a use case would be providing only the root and child nodes to the tree, use event listeners to get the selected node and add new nodes to that particular tree at runtime.

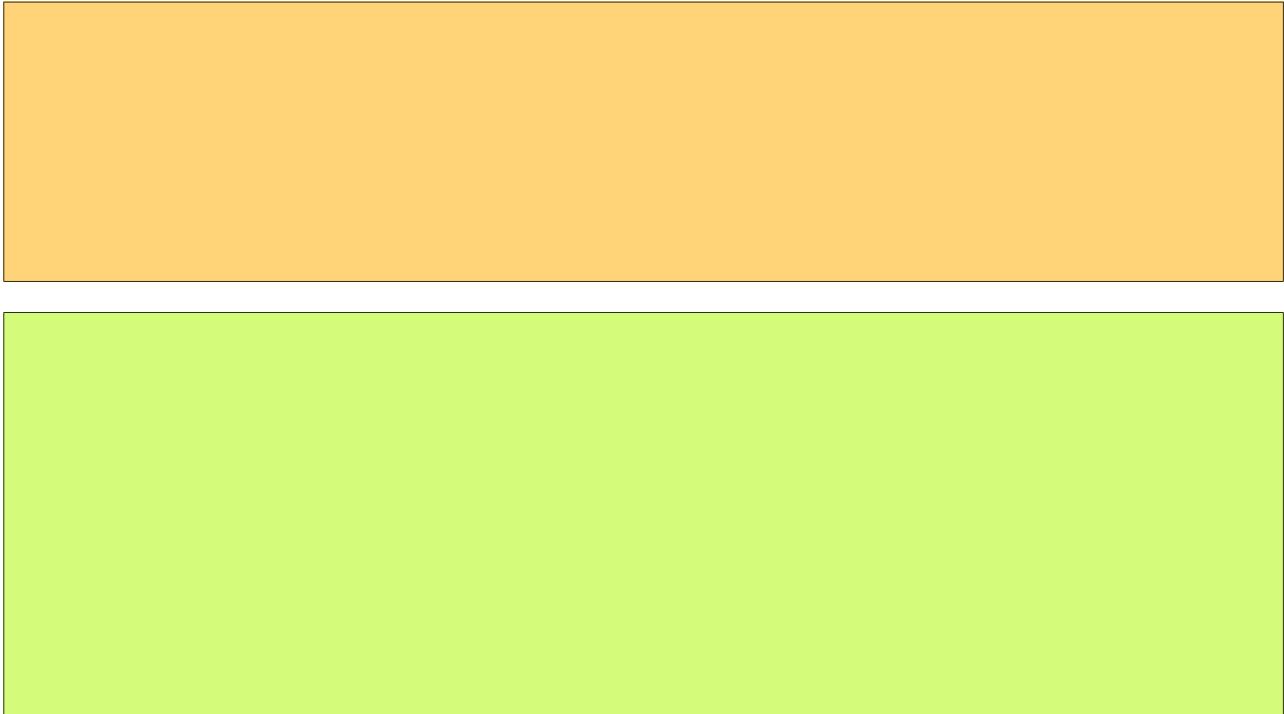

Selection

Node selection is a built-in feature of tree and it supports three different modes. Selection should be a `TreeNode` for single case and an array of `TreeNodes` for multiple and checkbox cases, tree finds the selected nodes and assign them to your selection model.

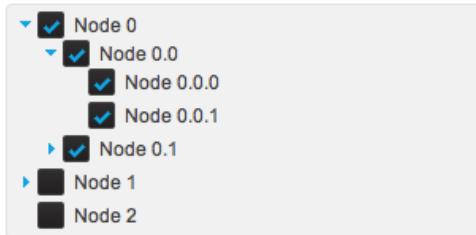

single: Only one at a time can be selected, selection should be a TreeNode reference.

multiple: Multiple nodes can be selected, selection should be a TreeNode[] reference.

checkbox: Multiple selection is done with checkbox UI, selection should be a TreeNode[] reference.

That's it, now the checkbox based tree looks like below. When the form is submitted with a command component like a button, selected nodes will be populated in selectedNodes property of TreeBean. As checkbox selection have a special hierarchy, use *CheckboxTreeNode* instead.

Node Caching

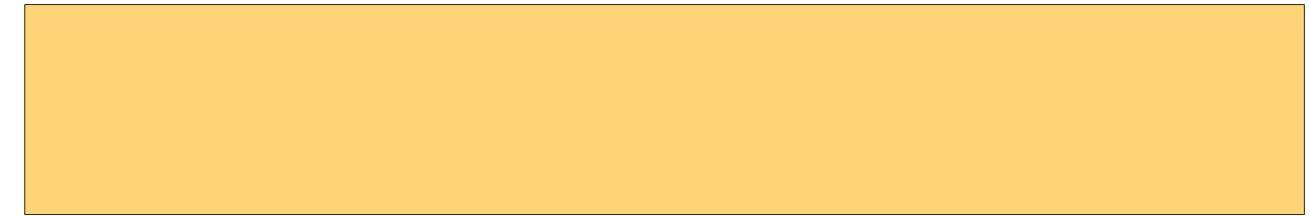

When caching is turned on by default, dynamically loaded nodes will be kept in memory so re-expanding a node will not trigger a server side request. In case it's set to false, collapsing the node will remove the children and expanding it later causes the children nodes to be fetched from server again.

Handling Node Click

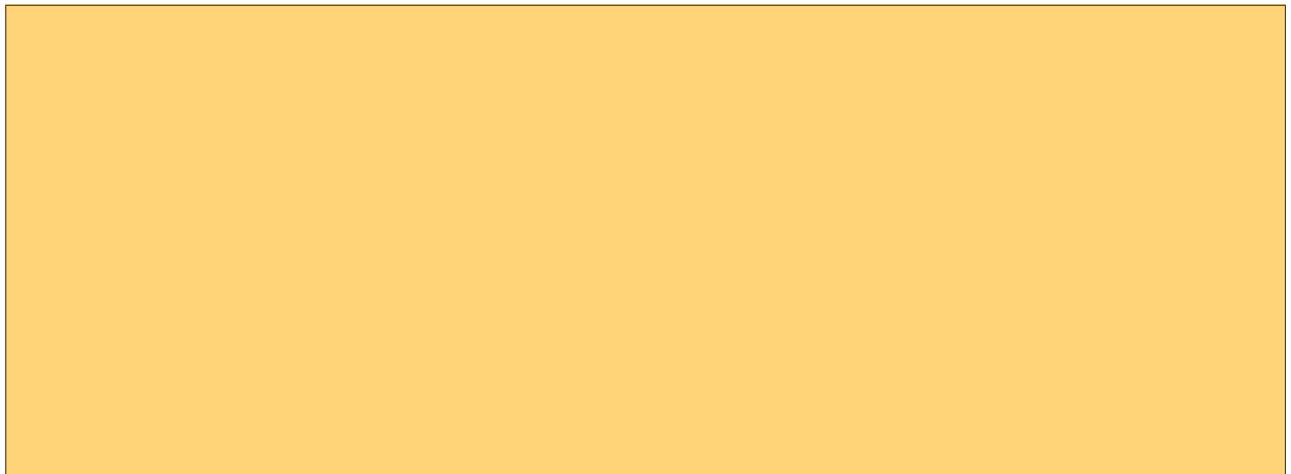

If you need to execute custom javascript when a treenode is clicked, use the *onNodeClick* attribute. Your javascript method will be invoked with passing the html element of the *node* and the click *event* as parameters. In case you have datakey defined, you can access datakey on client side by using *node.attr('data-datakey')* that represents the data represented by the backing tree model.

DragDrop

Tree nodes can be reordered within a single tree and can even be transferred between multiple trees using dragdrop. For a single tree enable draggable and droppable options.

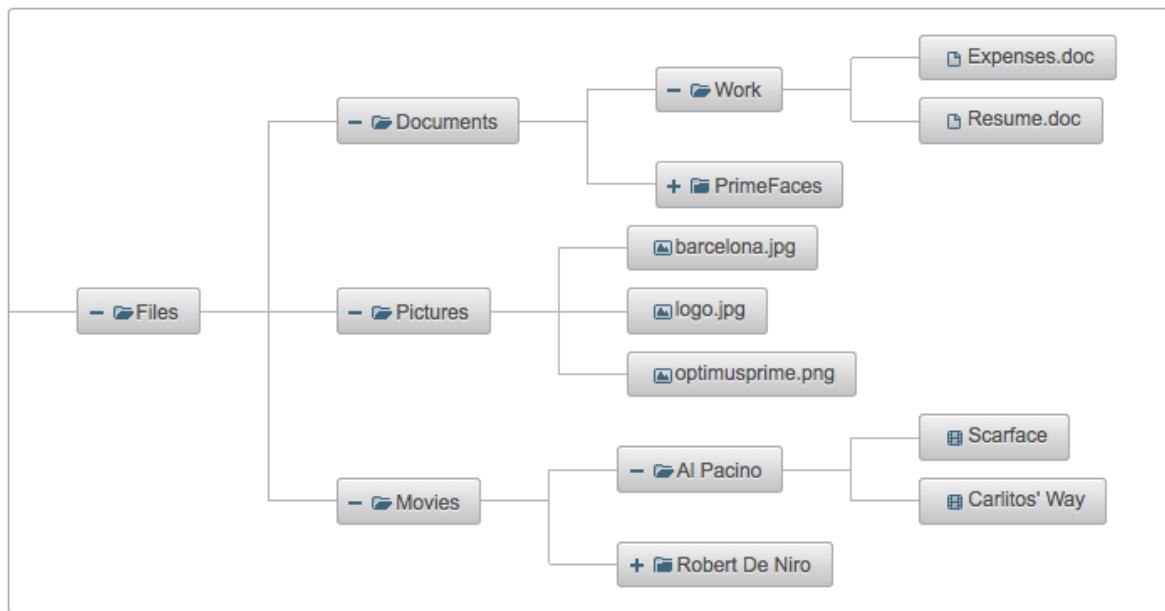

For multiple trees, use a scope attribute to match them and configure dragdrop options depending on your case, following example has 2 trees where one is the source and other is the target. Target can also be reordered within itself.

Two additional options exist for further configuration, *dragMode* defines the target node that would be dropped, default value is *self* and other values are *parent* and *ancestor*. *dropRestrict* on the other hand, can restrict the drop target to be within the parent by setting it to *sibling*.

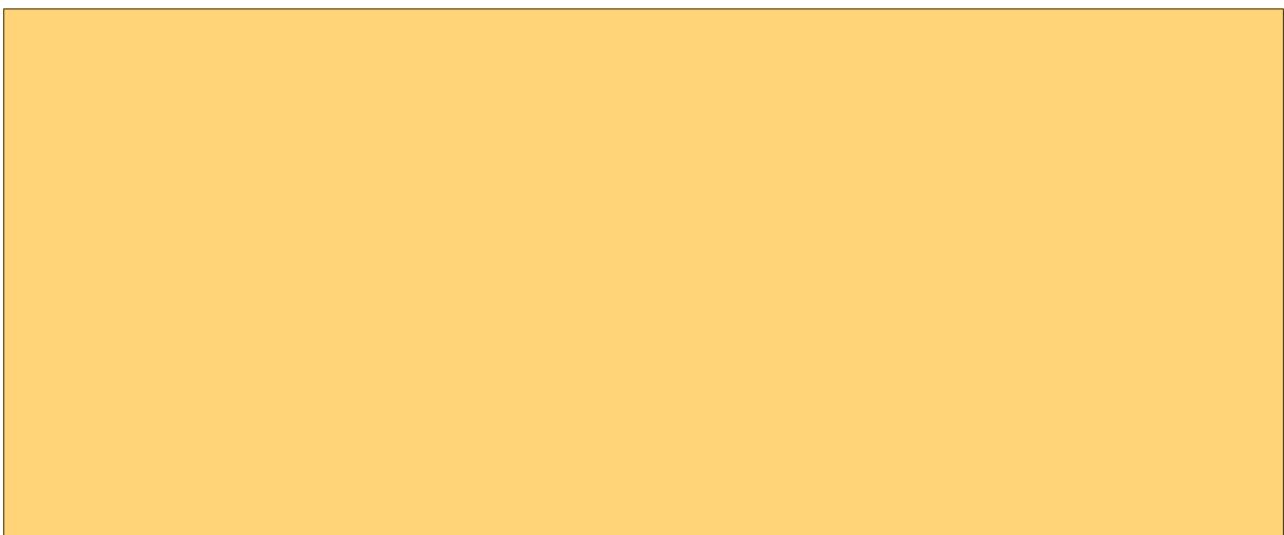

Horizontal Tree

Default orientation of tree is vertical, setting it to horizontal displays nodes in an horizontal layout. All features of vertical tree except dragdrop is available for horizontal tree as well.

ContextMenu

Tree has special integration with context menu, you can even match different context menus with different tree nodes using *nodeType* option of context menu that matches the tree node type. Note that selection must be enabled in tree component for context menu integration.

Skinning

Tree resides in a container element which *style* and *styleClass* options apply. Following is the list of structural style classes;

.ui-tree	Main container
.ui-tree-container	Root node container.
.ui-treenode	Tree node
.ui-treenode-content	Tree node content

.ui-treenode-icon	Tree node icon
.ui-tree-toggler	Toggle icon
.ui-treenode-label	Tree node label
.ui-treenode-parent	Nodes with children
.ui-treenode-leaf	Nodes without children

As skinning style classes are global, see the main theming section for more information.

3.158 TreeNode

TreeNode is used with Tree component to represent a node in tree.

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
type	default	String	Type of the tree node
styleClass	null	String	Style class to apply a particular tree node type
icon	null	String	Icon of the node.
expandedIcon	null	String	Expanded icon of the node.
collapsedIcon	null	String	Collapsed icon of the node.

Getting started with the TreeNode

TreeNode is used by Tree and TreeTable components, refer to sections of these components for more information.

3.159 TreeTable

Treetable is used for displaying hierarchical data in tabular format.

Attributes

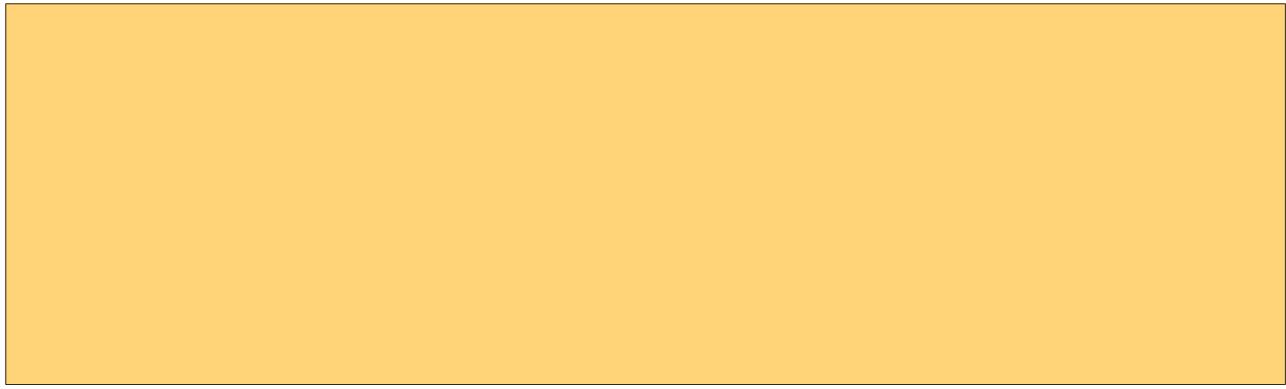

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	A TreeNode instance as the backing model.
var	null	String	Name of the request-scoped variable used to refer each treenode.
widgetVar	null	String	Name of the client side widget.
style	null	String	Inline style of the container element.
styleClass	null	String	Style class of the container element.
selection	null	Object	Selection reference.

selectionMode	null	String	Type of selection mode.
scrollable	false	Boolean	Whether or not the data should be scrollable.
scrollHeight	null	Integer	Height of scrollable data.
scrollWidth	null	Integer	Width of scrollable data.
tableStyle	null	String	Inline style of the table element.
tableStyleClass	null	String	Style class of the table element.
emptyMessage	No records found	String	Text to display when there is no data to display.
resizableColumns	false	Boolean	Defines if columns can be resized or not.
rowStyleClass	null	String	Style class for each row.
liveResize	false	Boolean	Columns are resized live in this mode without using a resize helper.
required	false	Boolean	Validation constraint for selection.
requiredMessage	null	String	Message for required selection validation.
sortBy	null	ValueExpr	Expression for default sorting.
sortOrder	ascendin g	String	Defines default sorting order.
sortFunction	null	MethodExpr	Custom pluggable sortFunction for default sorting.
nativeElements	false	Boolean	In native mode, treetable uses native checkboxes.
dataLocale	null	Object	Locale to be used in features such as sorting, defaults to view locale.
caseSensitiveSort	false	Boolean	Case sensitivity for sorting, insensitive by default.
skipChildren	false	Boolean	Ignores processing of children during lifecycle, improves performance if table only has output components.
showUnselectableCheckbox	false	Boolean	Defines if in checkbox selection mode, a readonly checkbox should be displayed for an unselectable node.
nodeVar	null	String	Name of the request-scoped variable that'll be used to refer current treenode using EL.
expandMode	children	String	Updates children only when set to "children" or the node itself with children when set to "self" on node expand.

stickyHeader	false	Boolean	Sticky header stays in window viewport during scrolling.
editable	false	Boolean	Controls incell editing.
editMode	row	String	Defines edit mode, valid values are "row" (default) and "cell".
editingRow	false	Boolean	Defines if cell editors of row should be displayed as editable or not. Default is false meaning display mode
cellSeparator	null	String	Separator text to use in output mode of editable cells with multiple components.
paginatorTemplate	null	String	Template of the paginator.
rowsPerPageTemplate	null	String	Template of the rowsPerPage dropdown.
currentPageReportTemplate	null	String	Template of the currentPageReport UI.
pageLinks	10	Integer	Maximum number of page links to display.
paginatorPosition	both	String	Position of the paginator.
paginatorAlwaysVisible	true	Boolean	Defines if paginator should be hidden if total data count is less than number of rows per page.
rows	0	Integer	Number of rows to display per page. Default value is 0 meaning to display all data available.
first	0	Integer	Index of the first data to display.
disabledTextSelection	true	Boolean	Disables text selection on row click.

Getting started with the TreeTable

Similar to the Tree, TreeTable is populated with an `org.primefaces.model.TreeNode` instance that corresponds to the root node. TreeNode API has a hierarchical data structure and represents the data to be populated in tree. For an example, model to be displayed is a collection of documents similar as in tree section.

Selection

Node selection is a built-in feature of tree and it supports two different modes. Selection should be a TreeNode for single case and an array of TreeNodes for multiple case, tree finds the selected nodes and assign them to your selection model.

single: Only one at a time can be selected, selection should be a TreeNode reference.

multiple or *checkbox*: Multiple nodes can be selected, selection should be a TreeNode[] reference.

As checkbox selection have a special hierarchy, use *CheckboxTreeNode* in checkbox mode.

Paginator

Node hierarchy can be displayed as paged using paginator. Usage is similar to DataTable, DataList and DataGrid where paginator is enabled by setting paginator="true" and defining a rows property to define the number of nodes to be displayed per page.

Ajax Behavior Events

TreeTable provides various ajax behavior events to respond user actions.

expand	org.primefaces.event.NodeExpandEvent	When a node is expanded.
collapse	org.primefaces.event.NodeCollapseEvent	When a node is collapsed.
select	org.primefaces.event.NodeSelectEvent	When a node is selected.
unselect	org.primefaces.event.NodeUnselectEvent	When a node is unselected.
colResize	org.primefaces.event.ColumnResizeEvent	When a column is resized.
sort	org.primefaces.event.SortEvent	When data is sorted
rowEdit	org.primefaces.event.RowEditEvent	On row edit.
rowEditInit	org.primefaces.event.RowEditEvent	When row edit is initialized.
rowEditCancel	org.primefaces.event.RowEditEvent	When row edit is cancelled.
cellEdit	org.primefaces.event.CellEditEvent	On cell edit.

ContextMenu

TreeTable has special integration with context menu, you can even match different context menus with different tree nodes using *nodeType* option of context menu that matches the tree node type.

Scrolling

Scollable TreeTable implementation is same as DataTable Scrollable, refer to scrolling part in DataTable section for detailed information.

Dynamic Columns

TreeTable supports dynamic columns via p:columns component, refer to dynamic columns in DataTable section for detailed information.

Column Priorities

Similar to DataTable, TreeTable columns can also be hidden depending on their priorities with respect to screen size.

Sorting

Sorting is enabled by setting *sortBy* expressions at column level.

In case you'd like to display treeTable as sorted on page load use *sortBy* attribute of treeTable, optional *sortOrder* and *sortFunction* attributes are provided to define the default sort order (ascending or descinding) and a java method to do the actual sorting respectively. Refer to datatable sorting section for an example usage of *sortFunction*.

Editing

Similar to DataTable, TreeTable supports row and cell based editing. Refer to datatable for more information.

Skinning

TreeTable content resides in a container element which style and styleClass attributes apply. Following is the list of structural style classes;

.ui-treetable	Main container element.
.ui-treetable-header	Header of treetable.
.ui-treetable-data	Body element of the table containing data

As skinning style classes are global, see the main theming section for more information.

3.160 TriStateCheckbox

TriStateCheckbox adds a new state to a checkbox value.

Renderer Class	

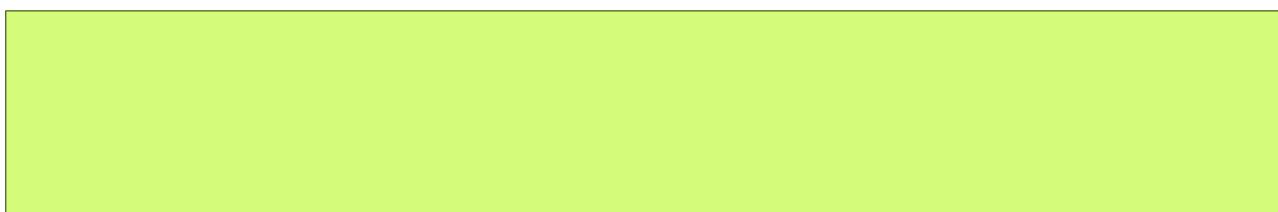

Attributes

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>value</code>	null	Object	Value of the component referring to a List.
<code>converter</code>	null	Converter/ String	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id
<code>immediate</code>	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
<code>required</code>	false	Boolean	Marks component as required
<code>validator</code>	null	Method Expr	A method expression that refers to a method validating the input
<code>valueChangeListener</code>	null	Method Expr	A method expression that refers to a method for handling a valuechangeevent
<code>requiredMessage</code>	null	String	Message to be displayed when required field validation fails.
<code>converterMessage</code>	null	String	Message to be displayed when conversion fails.

validatorMessage	null	String	Message to be displayed when validation fields.
widgetVar	null	String	Name of the client side widget.
disabled	false	Boolean	Disables the component.
stateOneIcon	null	String	Icon of the state one.
stateTwoIcon	null	String	Icon of the state two.
stateThreeIcon	null	String	Icon of the state three.
stateOneTitle	null	String	Title for state one.
stateTwoTitle	null	String	Title for state two
stateThreeTitle	null	String	Title for state three.
itemLabel	null	String	Label displayed next to checkbox.
tabindex	null	String	Specifies tab order for tab key navigation.
onchange	null	String	Client side callback to execute on state change.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
label	null	String	A localized user presentable name.

Getting started with TriStateCheckbox

TriStateCheckbox passes values “0”, “1”, “2” by default for each state and this can be customized using a converter.

Client Side API

Widget: `PrimeFaces.widget.TriStateCheckbox`

toggle()	-	void	Switches to next state.

Skinning

TriStateCheckbox resides in a main container which *style* and *styleClass* attributes apply. As skinning style classes are global, see the main theming section for more information. Following is the list of structural style classes;

.ui-chkbox	Main container element.
.ui-chkbox-box	Container of checkbox icon.
.ui-chkbox-icon	Checkbox icon.
.ui-chkbox-label	Checkbox label.

3.161 Watermark

Watermark displays a hint on an input field.

[Search with a keyword](#)

Info

Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Text of watermark.
for	null	String	Component to attach the watermark

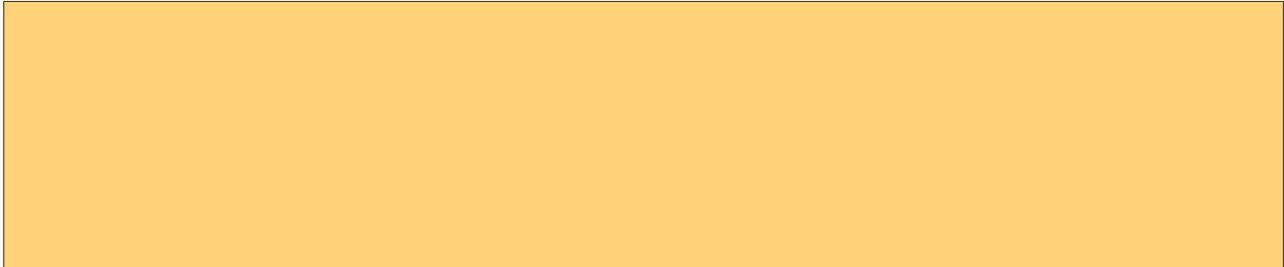

Getting started with Watermark

Watermark requires a target of the input component. In case you don't need to support legacy browsers, prefer placeholder attribute of input components over watermark.

Form Submissions

Watermark is set as the text of an input field which shouldn't be sent to the server when an enclosing form is submitted. This would result in updating bean properties with watermark values. Watermark component is clever enough to handle this case, by default in non-ajax form submissions, watermarks are cleared. However ajax submissions requires a little manual effort.

Please note that this only applies to legacy browsers, as watermark uses HTML5 placeholder option when available.

Skinning

For browsers that do not support placeholder, there's only one css style class applying watermark which is '*.ui-watermark*', you can override this class to bring in your own style.

3.162 Wizard

Wizard provides an ajax enhanced UI to implement a workflow easily in a single page. Wizard consists of several child tab components where each tab represents a step in the process.

The screenshot shows a wizard component with four tabs: Personal, Address, Contact, and Confirmation. The Personal tab is selected and active. Inside the Personal tab, there is a panel titled "Personal Details" containing four input fields: "Firstname:" with a required asterisk, "Lastname:", "Age:", and a checkbox labeled "Skip to last". At the bottom right of the panel is a "Next" button.

Info

Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component.
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
step	0	String	Id of the current step in flow
style	null	String	Style of the main wizard container element.
styleClass	null	String	Style class of the main wizard container element.
flowListener	null	MethodExpr	Server side listener to invoke when wizard attempts to go forward or back.
showNavBar	true	Boolean	Specifies visibility of default navigator arrows.
showStepStatus	true	Boolean	Specifies visibility of default step title bar.

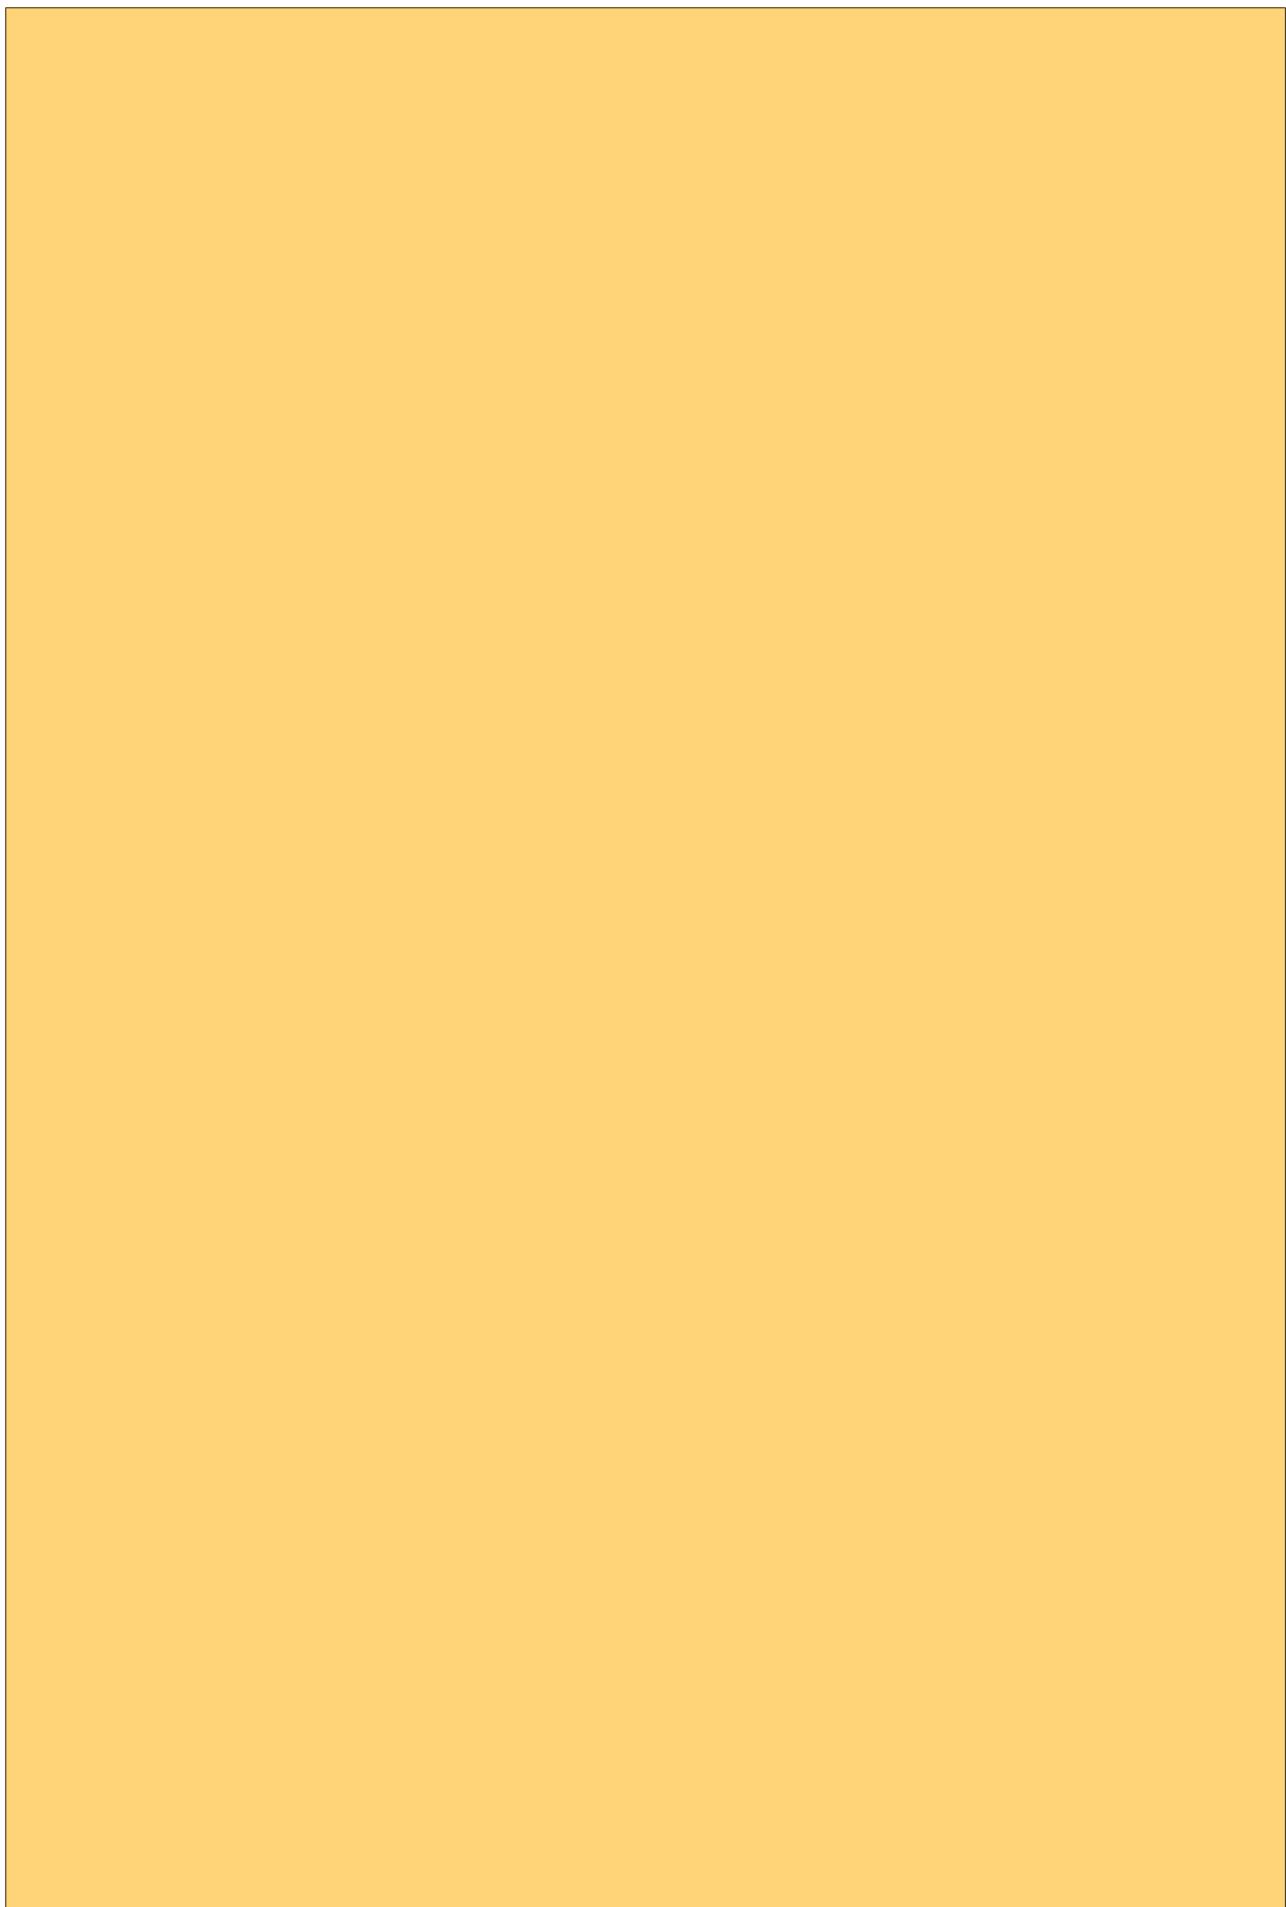

onback	null	String	Javascript event handler to be invoked when flow goes back.
onnext	null	String	Javascript event handler to be invoked when flow goes forward.
nextLabel	null	String	Label of next navigation button.
backLabel	null	String	Label of back navigation button.
widgetVar	null	String	Name of the client side widget

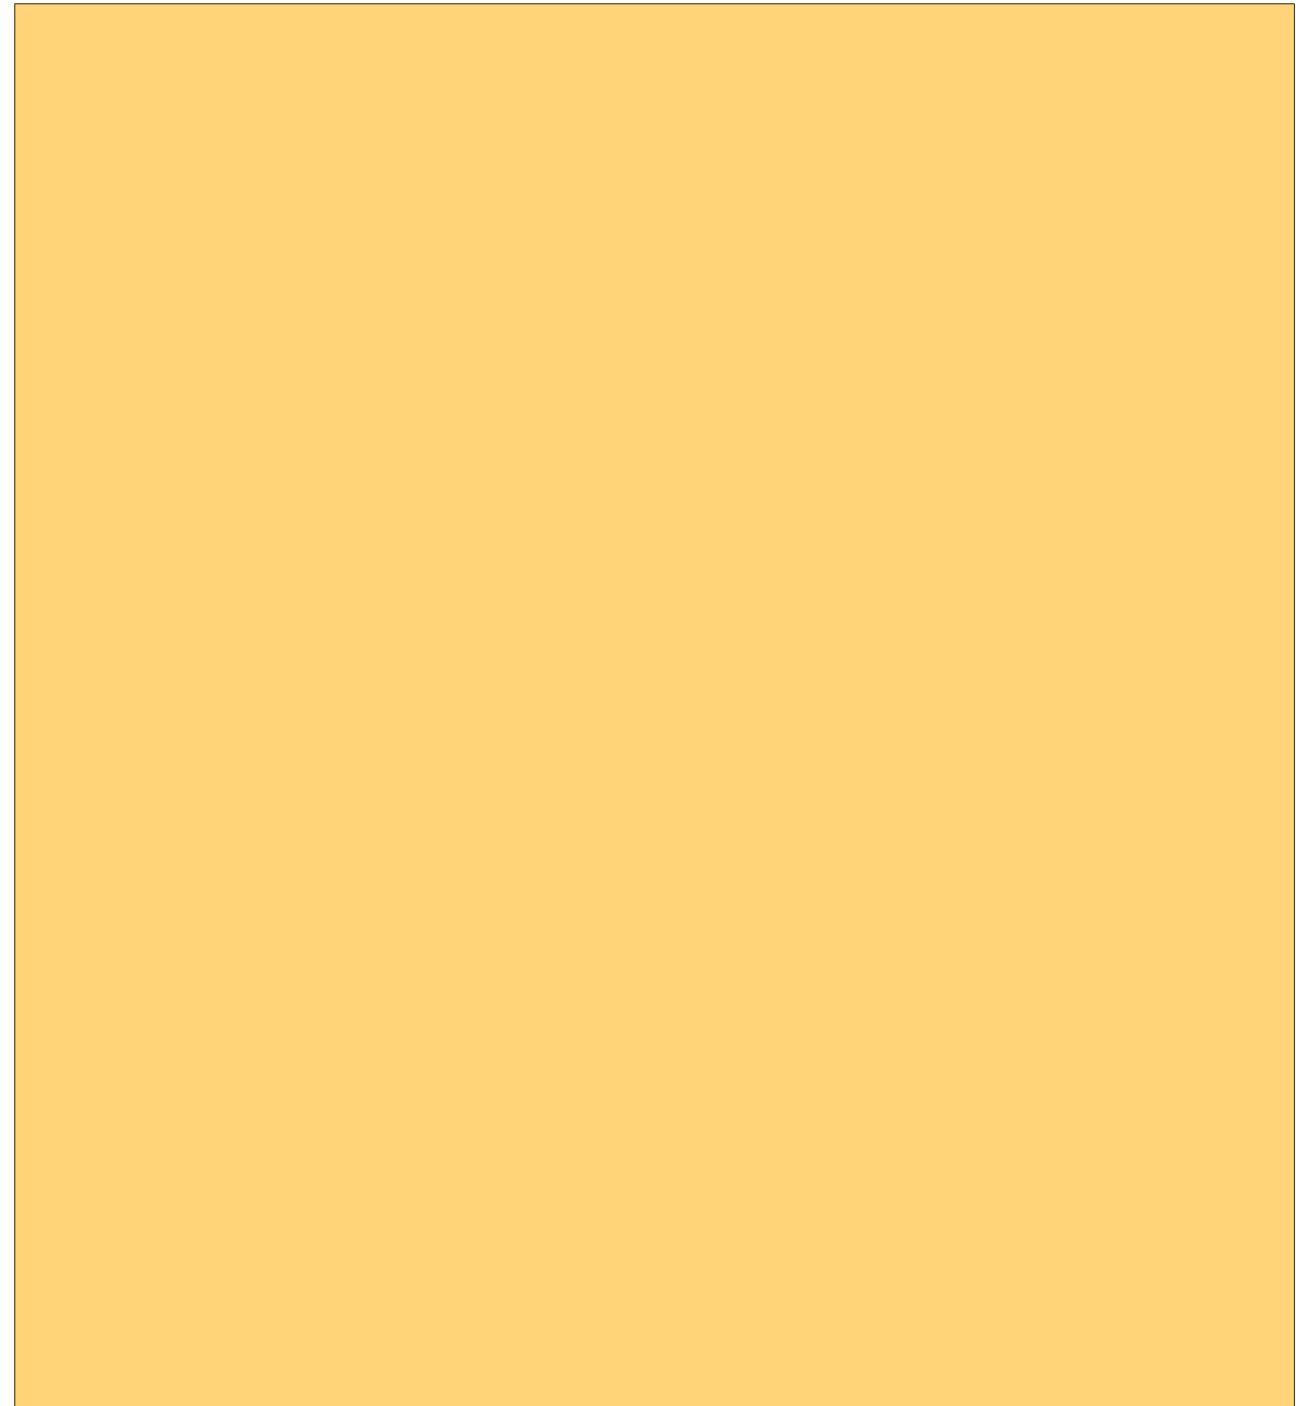

Getting Started with Wizard

Each step in the flow is represented with a tab. As an example following wizard is used to create a new user in a total of 4 steps where last step is for confirmation of the information provided in first 3 steps. To begin with create your backing bean, it's important that the bean lives across multiple requests so avoid a request scope bean. Optimal scope for wizard is viewScope.

User is a simple pojo with properties such as firstname, lastname, email and etc. Following wizard requires 3 steps to get the user data; Personal Details, Address Details and Contact Details. Note that last tab contains read-only data for confirmation and the submit button.

AJAX and Partial Validations

Switching between steps is based on ajax, meaning each step is loaded dynamically with ajax. Partial validation is also built-in, by this way when you click next, only the current step is validated, if the current step is valid, next tab's contents are loaded with ajax. Validations are not executed when flow goes back.

Navigations

Wizard provides two icons to interact with; next and prev. Please see the skinning wizard section to know more about how to change the look and feel of a wizard.

Custom UI

By default wizard displays right and left arrows to navigate between steps, if you need to come up with your own UI, set `showNavBar` to false and use the provided the client side api.

FlowListener

If you'd like get notified on server side when wizard attempts to go back or forward, define a `flowListener`.

Steps here are simply the ids of tab, by using a `flowListener` you can decide which step to display next so wizard does not need to be linear always. If you need to update other component(s) on page within a flow, use `RequestContext.update(String clientId)` api.

Client Side Callbacks

Wizard is equipped with `onback` and `onnext` attributes, in case you need to execute custom javascript after wizard goes back or forth. You just need to provide the names of javascript functions as the values of these attributes.

Client Side API

Widget: `PrimeFaces.widget.Wizard`

next()	-	void	Proceeds to next step.
back()	-	void	Goes back in flow.
getStepIndex()	-	Number	Returns the index of current step.
showNextNav()	-	void	Shows next button.
hideNextNav()	-	void	Hides next button.
showBackNav()	-	void	Shows back button.
hideBackNav()	-	void	Hides back button.

Skinning

Wizard resides in a container element that *style* and *styleClass* attributes apply. Following is the list of structural css classes.

.ui-wizard	Main container element.
.ui-wizard-content	Container element of content.
.ui-wizard-step-titles	Container of step titles.
.ui-wizard-step-title	Each step title.
.ui-wizard-navbar	Container of navigation controls.
.ui-wizard-nav-back	Back navigation control.
.ui-wizard-nav-next	Forward navigation control.

As skinning style classes are global, see the main theming section for more information.

4. Partial Rendering and Processing

PrimeFaces provides a partial rendering and view processing feature based on standard JSF 2 APIs to enable choosing what to process in JSF lifecycle and what to render in the end with ajax.

4.1 Partial Rendering

In addition to components like autoComplete, datatable, slider with built-in ajax capabilities, PrimeFaces also provides a generic PPR (Partial Page Rendering) mechanism to update JSF components with ajax. Several components are equipped with the common PPR attributes (e.g. update, process, onstart, oncomplete).

4.1.1 Infrastructure

PrimeFaces Ajax Framework is based on standard server side APIs of JSF 2. There are no additional artifacts like custom AjaxViewRoot, AjaxStateManager, AjaxViewHandler, Servlet Filters, HtmlParsers, PhaseListeners and so on. PrimeFaces aims to keep it clean, fast and lightweight.

On client side rather than using client side API implementations of JSF implementations like Mojarra and MyFaces, PrimeFaces scripts are based on the most popular javascript library; jQuery which is far more tested, stable regarding ajax, dom handling, dom tree traversing than a JSF implementations scripts.

4.1.2 Using IDs

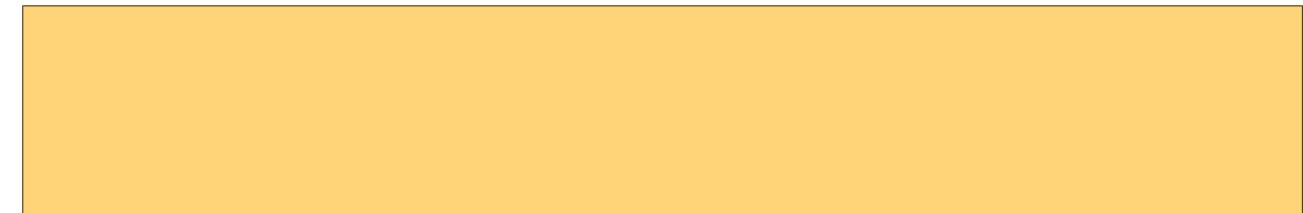

Getting Started

When using PPR you need to specify which component(s) to update with ajax. If the component that triggers PPR request is at the same namingcontainer (eg. form) with the component(s) it renders, you can use the server ids directly. In this section although we'll be using commandButton, same applies to every component that's capable of PPR such as commandLink, poll, remoteCommand and etc.

prependId

Setting prependId setting of a form has no effect on how PPR is used.

ClientId

It is also possible to define the client id of the component to update.

Different NamingContainers

If your page has different naming containers (e.g. two forms), you also need to add the container id to search expression so that PPR can handle requests that are triggered inside a namingcontainer that updates another namingcontainer. Following is the suggested way using separator char as a prefix, note that this uses same search algorithm as standard JSF 2 implementation;

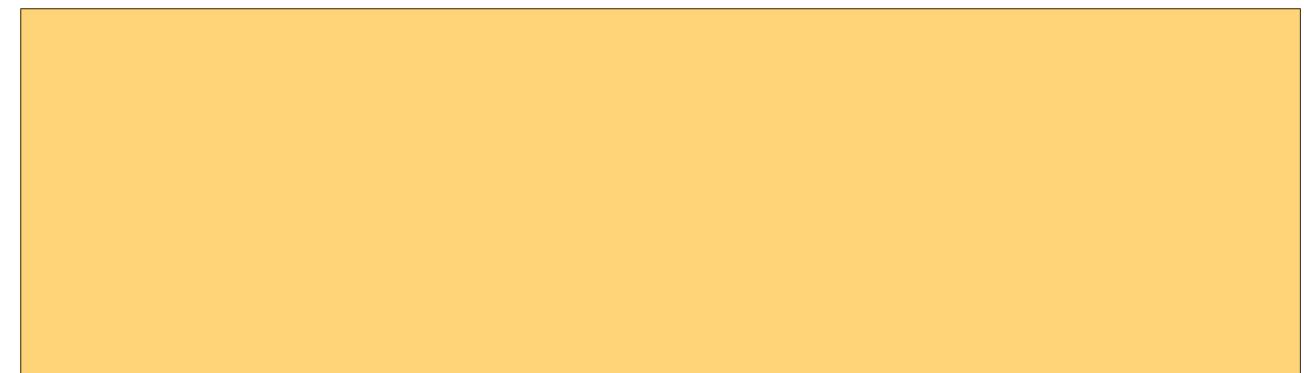

Please read [algorithm described in link below](#) used by both JSF core and PrimeFaces to fully understand how component referencing works.

JSF h:form, datatable, composite components are naming containers, in addition tabView, accordionPanel, dataTable, dataGrid, dataList, carousel, galleria, ring, sheet and subTable are PrimeFaces component that implement NamingContainer.

Multiple Components

Multiple components to update can be specified with providing a list of ids separated by a comma, whitespace or even both.

4.1.3 Notifying Users

ajaxStatus is the component to notify the users about the status of ajax requests. See the ajaxStatus section to get more information about the component.

Global vs Non-Global

By default ajax requests are global, meaning if there is an ajaxStatus component present on page, it is triggered.

If you want to do a "silent" request not to trigger ajaxStatus instead, set global to false. An example with commandButton would be;

4.1.4 Bits&Pieces

PrimeFaces Ajax Javascript API

See the javascript section to learn more about the PrimeFaces Javascript Ajax API.

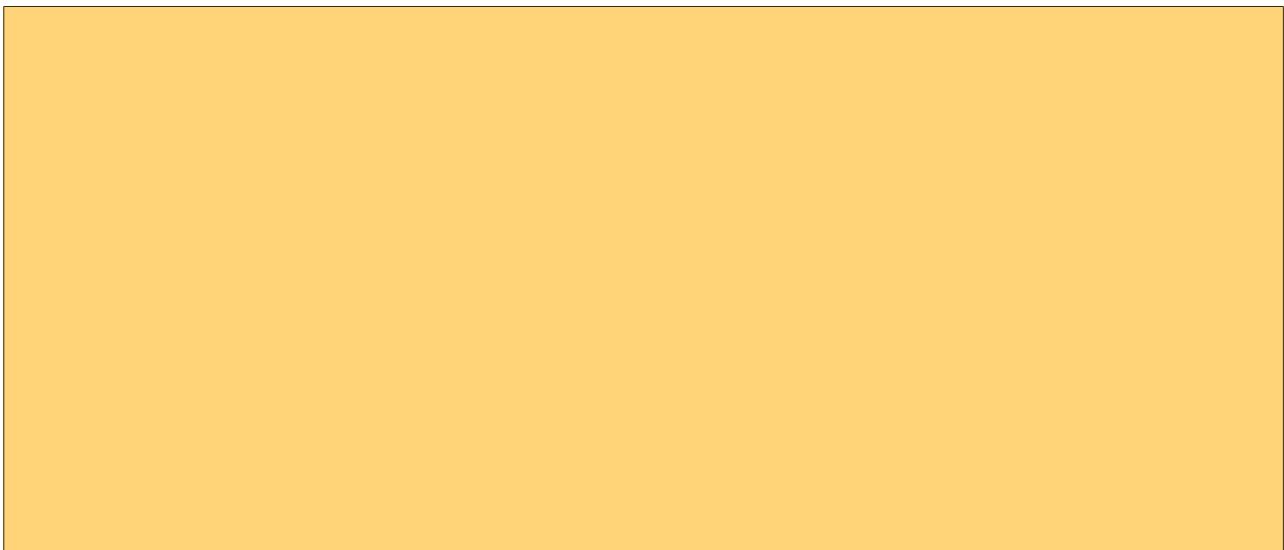

4.2 Partial Processing

In Partial Page Rendering, only specified components are rendered, similarly in Partial Processing only defined components are processed. Processing means executing Apply Request Values, Process Validations, Update Model and Invoke Application JSF lifecycle phases only on defined components.

This feature is a simple but powerful enough to do group validations, avoiding validating unwanted components, eliminating need of using immediate and many more use cases. Various components such as commandButton, commandLink are equipped with process attribute, in examples we'll be using commandButton.

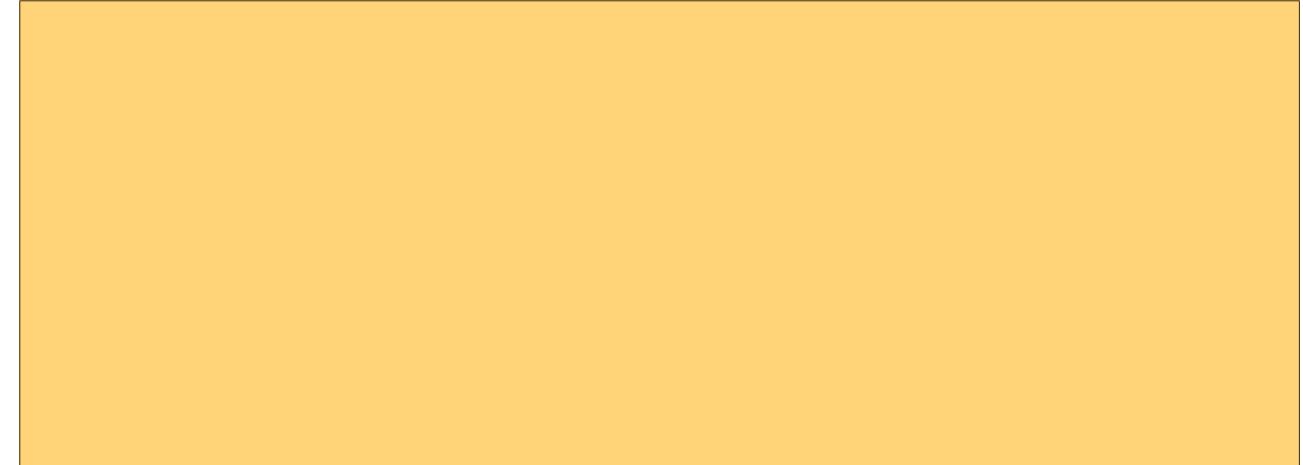

4.2.1 Partial Validation

A common use case of partial process is doing partial validations, suppose you have a simple contact form with two dropdown components for selecting city and suburb, also there's an inputText which is required. When city is selected, related suburbs of the selected city is populated in suburb dropdown.

When the city dropdown is changed an ajax request is sent to execute populateSuburbs method which populates suburbChoices and finally update the suburbs dropdown. Problem is populateSuburbs method will not be executed as lifecycle will stop after process validations phase to jump render response as email input is not provided. Reason is p:ajax has @all as the value stating to process every component on page but there is no need to process the inputText.

The solution is to define what to process in p:ajax. As we're just making a city change request, only processing that should happen is cities dropdown.

That is it, now `populateSuburbs` method will be called and suburbs list will be populated. Note that default value for process option is `@this` already for `p:ajax` as stated in AjaxBehavior documentation, it is explicitly defined here to give a better understanding of how partial processing works.

4.2.2 Using Ids

Partial Process uses the same technique applied in partial updates to specify component identifiers to process.

4.3 Search Expression Framework

Core JSF component referencing is based on component identifiers only with basic keyword support. PrimeFaces Search Expression Framework (SEF) provides both server side and client side extensions to make it easier to reference components. SEF is utilized in partial update, process and whenever a component references another component.

4.3.1 Keywords

Keywords are the easier way to reference components, they resolve to ids so that if an id changes, the reference does not need to change. Core JSF provides a couple of keywords and PrimeFaces provides more along with composite expression support.

@this	Standard	Current component.
@all	Standard	Whole view.
@form	Standard	Closest ancestor form of current component.
@none	Standard	No component.
@namingcontainer	PrimeFaces	Closest ancestor naming container of current component.
@parent	PrimeFaces	Parent of the current component.
@composite	PrimeFaces	Closest composite component ancestor.
@child(n)	PrimeFaces	nth child.
@row(n)	PrimeFaces	nth row.
@previous	PrimeFaces	Previous sibling.
@next	PrimeFaces	Next sibling.
@widgetVar(name)	PrimeFaces	Component with given widgetVar.
@root	PrimeFaces	UIViewRoot instance of the view, can be used to start searching from the root instead the current component.
@id	PrimeFaces	Used to search components by their id ignoring the component tree structure and naming containers.

Consider the following case where ids are used for referencing;

Using keywords, same can be written as;

Composite Expressions

Multiple keywords can be combined in a single expression using colon;

- @form:@parent
- @composite:mybuttonid
- @this:@parent:@parent
- @form:@child(2)

Usage Scenarios

SEF is not just at partial process and update, they are also available whenever a component is referencing another.

4.3.2 PrimeFaces Selectors (PFS)

PFS integrates jQuery Selector API with JSF component referencing model so that referencing can be done using jQuery Selector API instead of core id based JSF model. Best way to explain the power of PFS is examples;

Update all forms

Update first form

Update all components that has styleClass named mystyle

Update and process all inputs

Update all datatables

Process input components inside any panel and update all panels

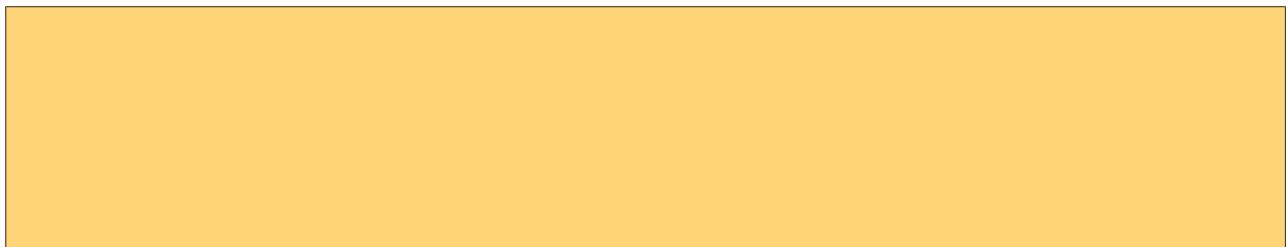

Process input components but not select components

Update input components that are disabled

PFS can be used with other referencing approaches as well;

PFS provides an alternative, flexible, grouping based approach to reference components to partially process and update. There is less CPU server load compared to regular referencing because JSF component tree is not traversed on server side to find a component and figure out the client id as PFS is implemented on client side by looking at dom tree. Another advantage is avoiding naming container limitations, just remember the times you've faced with cannot find component exception since the component you are looking for is in a different naming container like a form or a datatable. PFS can help you out in tricky situations by following jQuery's "write less do more" style.

For PFS to function properly and not to miss any component, it is required to have explicitly defined ids on the matched set as core JSF components usually do not render auto ids. So even though manually defined ids won't be referenced directly, they are still required for PFS to be collected and send in the request.

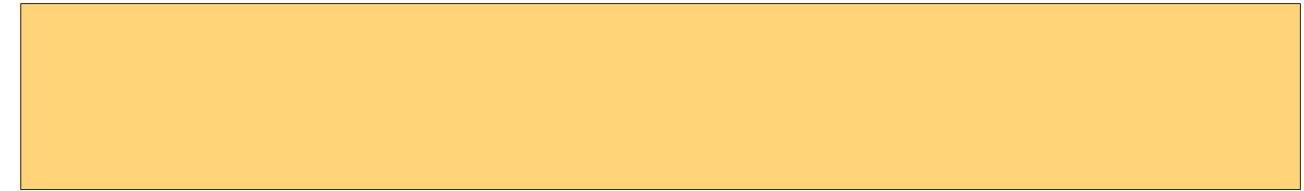

For full reference of jQuery selector api, see;

4.4 PartialSubmit

Core JSF Ajax implementation and by default PrimeFaces serializes the whole form to build the post data in ajax requests so the same data is posted just like in a non-ajax request. This has a downside in large views where you only need to process/execute a minor part of the view. Assume you have a form with 100 input fields, there is an input field with ajaxbehavior attached processing only itself(@this) and then updates another field onblur. Although only a particular input field is processed, whole form data will be posted with the unnecessary information that would be ignored during server side processing but consume resources.

PrimeFaces provides partialSubmit feature to reduce the network traffic and computing on client side. When partialSubmit is enabled, only data of components that will be partially processed on the server side are serialized. By default partialSubmit is disabled and you can enable it globally using a context parameter.

Components like buttons and behaviors like p:ajax are equipped with partialSubmit option so you can override the global setting per component.

5. Javascript API

PrimeFaces renders unobtrusive javascript which cleanly separates behavior from the html. Client side engine is powered by jQuery version 1.8.1 which is the latest at the time of the writing.

5.1 PrimeFaces Namespace

PrimeFaces is the main javascript object providing utilities and namespace.

escapeClientId(id)	Escaped JSF ids with semi colon to work with jQuery.
addSubmitParam(el, name, param)	Adds request parameters dynamically to the element.
getCookie(name)	Returns cookie with given name.
setCookie(name, value, cfg)	Sets a cookie with given name, value and options. e.g. <code>PrimeFaces.setCookie('name', 'test');</code> <code>PrimeFaces.setCookie('name','test',{expires:7, path:'/'})</code> Second example creates cookie for entire site that expires in 7 days.
deleteCookie(name, cfg)	Deletes a cookie with given and options.
skinInput(input)	Progressively enhances an input element with theming.
info(msg), debug(msg), warn(msg), error(msg)	Client side log API.
changeTheme(theme)	Changes theme on the fly with no page refresh.
cleanWatermarks()	Watermark component extension, cleans all watermarks on page before submitting the form.
showWatermarks()	Shows watermarks on form.
getWidgetById(clientid)	Returns the widget instance from the client id

To be compatible with other javascript entities on a page, PrimeFaces defines two javascript namespaces;

Contains custom PrimeFaces widgets like;

- PrimeFaces.widget.DataTable
- PrimeFaces.widget.Tree
- PrimeFaces.widget.Poll
- and more...

Most of the components have a corresponding client side widget with same name.

*PrimeFaces.ajax.**

PrimeFaces.ajax namespace contains the ajax API which is described in next section.

5.2 Ajax API

PrimeFaces Ajax Javascript API is powered by jQuery and optimized for JSF. Whole API consists of three properly namespaced simple javascript functions.

PrimeFaces.ajax.Request

Sends ajax requests that execute JSF lifecycle and retrieve partial output. Function signature is as follows;

Examples

Suppose you have a JSF page called *createUser* with a simple form and some input components.

You can post all the information with ajax using;

More complex example with additional options;

We highly recommend using p:remoteComponent instead of low level javascript api as it generates the same with much less effort and less possibility to do an error.

PrimeFaces.ajax.Response

PrimeFaces.ajax.Response.handle() updates the specified components if any and synchronizes the client side JSF state. DOM updates are implemented using jQuery which uses a very fast algorithm.

Abort

Use the abort API in case you'd like to cancel all the ongoing requests;

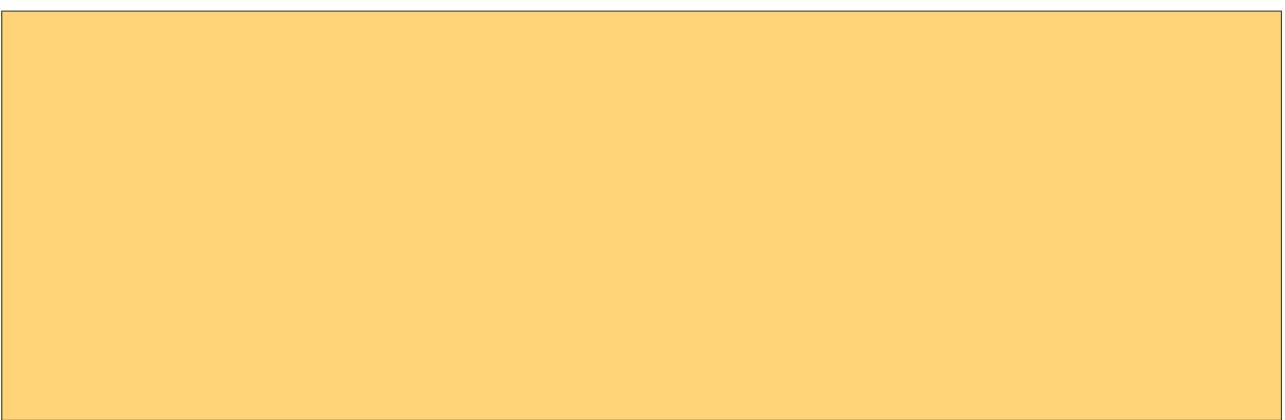

6. Dialog Framework

Dialog Framework (DF) is used to open an external xhtml page in a dialog that is generated dynamically on runtime. This is quite different to regular usage of dialogs with declarative p:dialog components as DF is based on a programmatic API where dialogs are created and destroyed at runtime. Note that DF and the declarative approach are two different ways and both can even be used together. Usage is quite simple, RequestContext has openDialog and closeDialog methods;

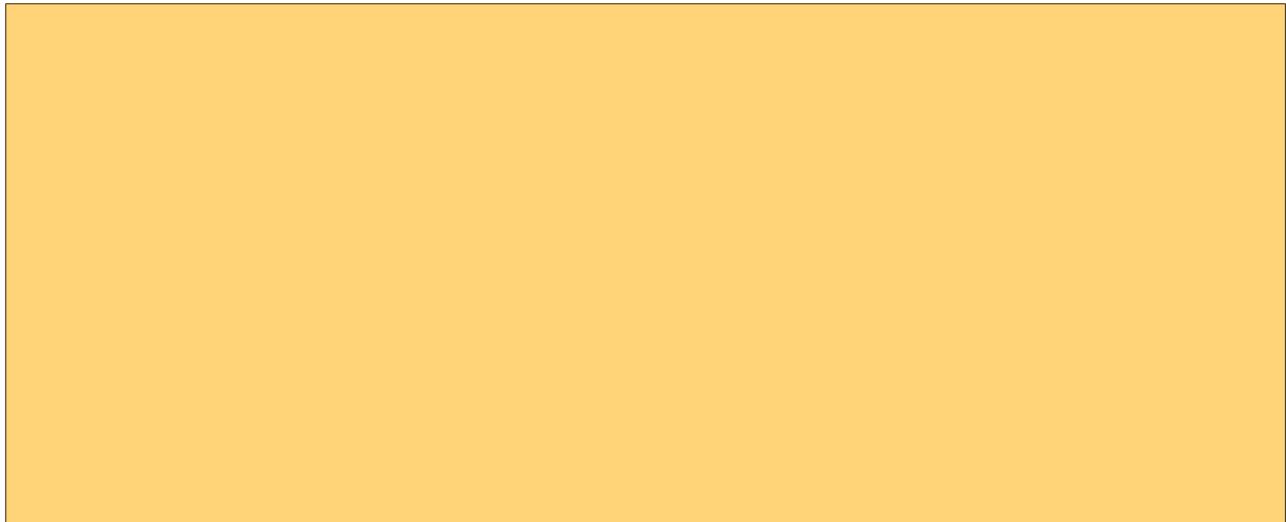

Configuration

DF requires the following configuration to be present in faces config file.

Getting Started

Simplest use case of DF is opening an xhtml view like *cars.xhtml* in a dialog;

On the host page, call `RequestContext.openDialog("viewname");`

Once the response is received from the request caused by command button a dialog would be generated with the contents of viewCars.xhtml. Title of the dialog is retrieved from the title element of the viewCars, in this case, Cars.

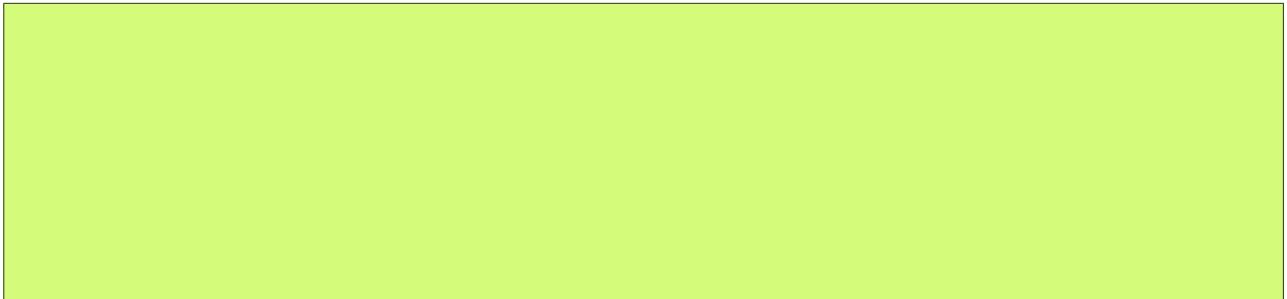

Dialog Configuration

Overloaded `openDialog` method provides advanced configuration regarding the visuals of dialog along with parameters to send to the dialog content.

Here is the full list of configuration options:

At host page, the button that triggered the dialog should have *dialogReturn* event.

Remarks on Dialog Framework

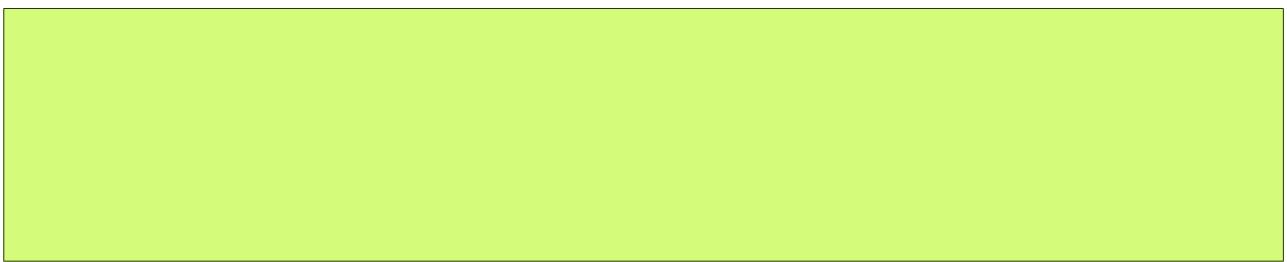

- Calls to DialogFramework API within a non-ajax are ignored.
- Content Width and Height can take percentage value like 100%.

Dialog Messages

Displaying FacesMessages in a Dialog is a common case where a facesmessage needs to be added to the context first, dialog content containing a message component needs to be updated and finally dialog gets shown with client side api. DF has a simple utility to bypass this process by providing a shortcut;

Using this shortcut it is just one line to implement the same functionality;

7. Client Side Validation

PrimeFaces Client Side Validation (CSV) Framework is the most complete and advanced CSV solution for JavaServer Faces and Java EE. CSV support for JSF is not an easy task, it is not simple as integrating a 3rd party javascript plugin as JSF has its own lifecycle, concepts like conversion and then validation, partial processing, facesmessages and many more. Real CSV for JSF should be compatible with server side implementation, should do what JSF does, so that users do not experience difference behaviors on client side and server side.

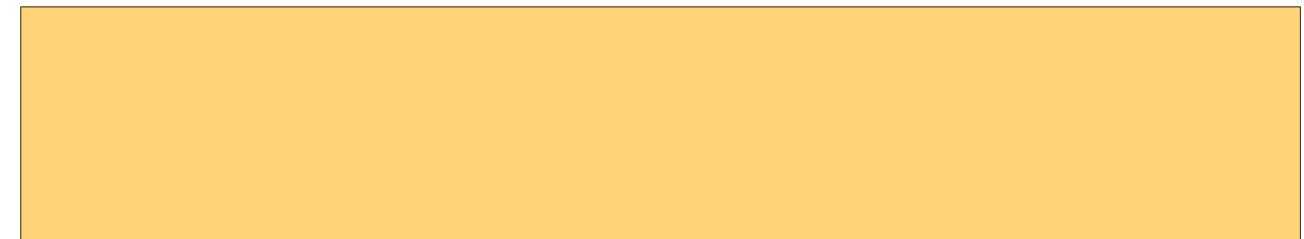

- Compatible with Server Side Implementation.
- Conversion and Validation happens at client side.
- Partial Process&Update support for Ajax.
- I18n support along with component specific messages.
- Client side Renderers for message components.
- Easy to write custom client converters and validators.
- Global or Component based enable/disable.
- Advanced Bean Validation Integration.
- Little footprint using HTML5.

7.1 Configuration

CVS is disabled by default and a global parameter is required to turn it on.

At page level, enable *validateClient* attribute of commandButton and commandLink components.

That is all for the basics, clicking the button validates the form at client side and displays the errors using messages component.

CSV works for PrimeFaces components only, standard h: * components are not supported.

7.2 Ajax vs Non-Ajax

CSV works differently depending on the request type of the trigger component to be compatible with cases where CVS is not enabled.

Non-Ajax

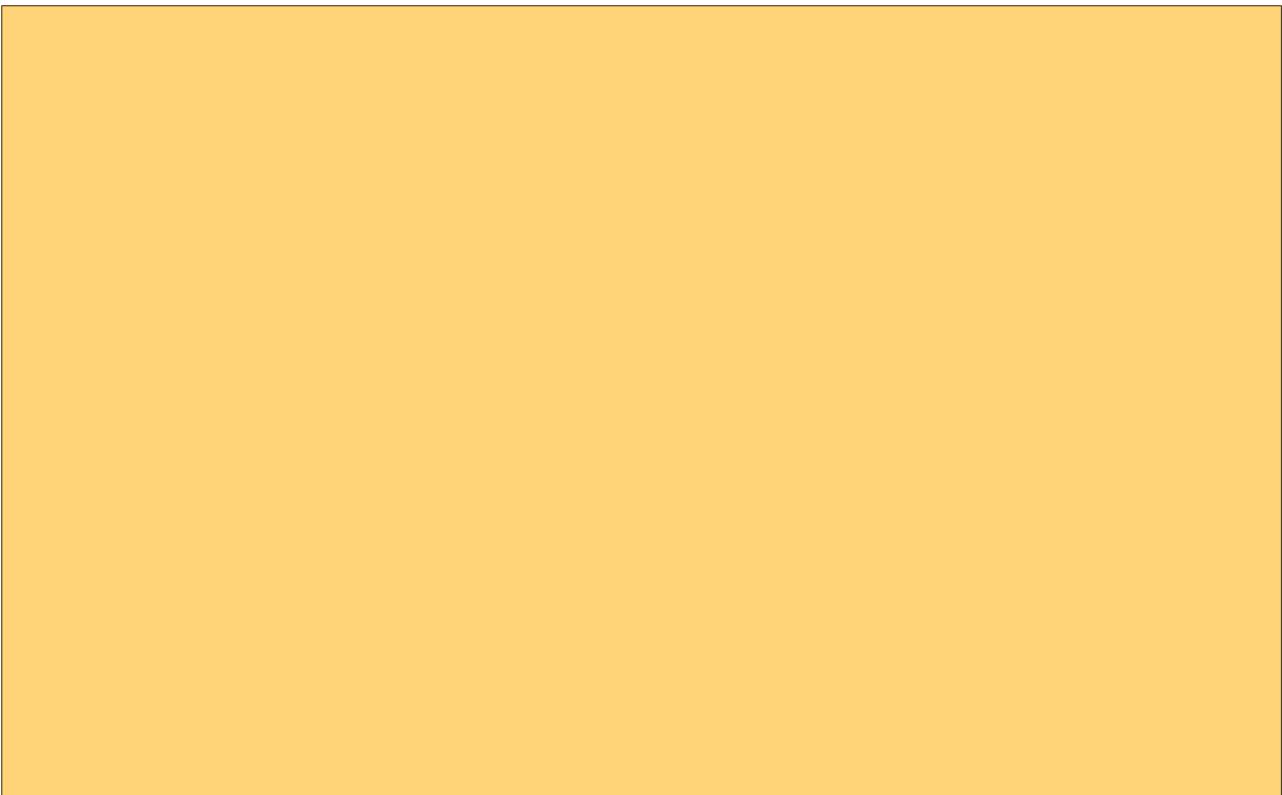

In non-ajax case, all visible and editable input components in the form are validated and message components must be placed inside the form.

Ajax

CSV supports partial processing and updates on client side as well, if process attribute is enabled, the components that would be processed at server side gets validated at client side. Similary if update attribute is defined, only message components inside the updated parts gets rendered. Whole process happens at client side.

7.3 Events

CSV provides a behavior called p:clientValidator to do instant validation in case you do not want to wait for the users to fill in the form and hit commandButton/commandLink. Using clientBehavior and custom events, CSV for a particular component can run with events such as change (default), blur, keyup.

7.4 Messages

Validation errors are displayed as the same way in server side validation, texts are retrieved from a client side bundle and message components are required for the displays.

I18N

Default language is English for the CSV messages and for other languages or to customize the default messages, PrimeFaces Locales bundle needs to be present at the page if you'd like to provide translations. For more info on PrimeFaces Locales, visit <http://code.google.com/p/primefaces/wiki/PrimeFacesLocales>.

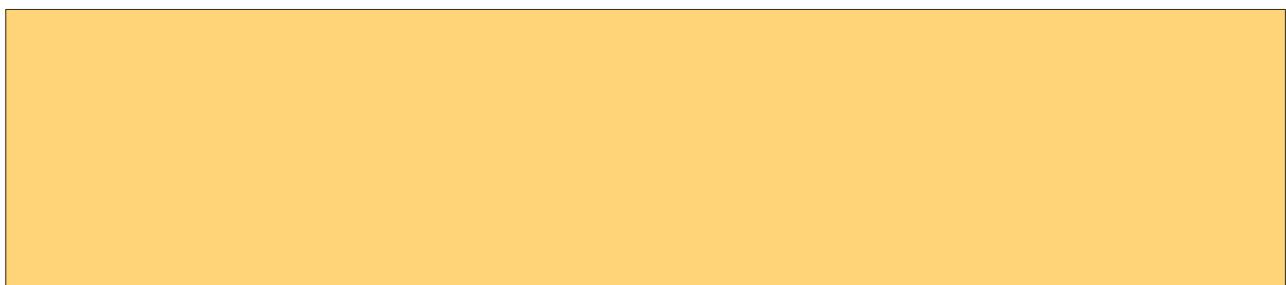

Rendering

PrimeFaces message components have client side renderers for CSV support, these are p:message, p:messages and p:growl. Component options like showSummary, showDetail, globalOnly, mode are all implemented by client side renderer for compatibility.

Bean validation messages between implementations have a slight difference regarding labels, mojarra do not the label of the field but myfaces does. For example;

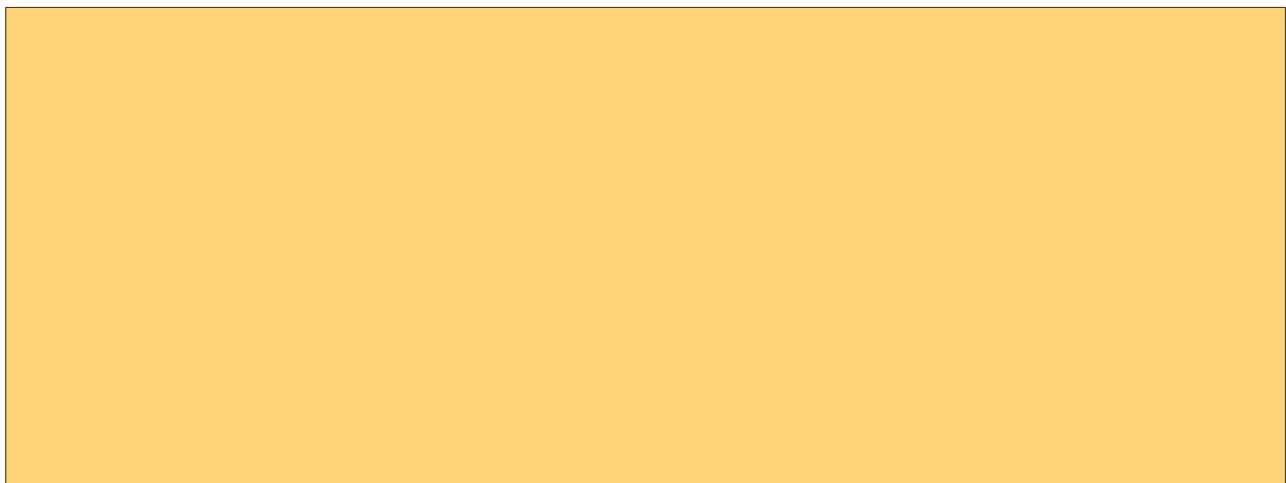

Default CSV messages follow the convention of Mojarra however if you prefer to display the label along with the message, override can be done by adding {1} to the message;

7.5 Bean Validation

CSV has built-in integration with Bean Validation by validating the constraints defined with annotations at client side.

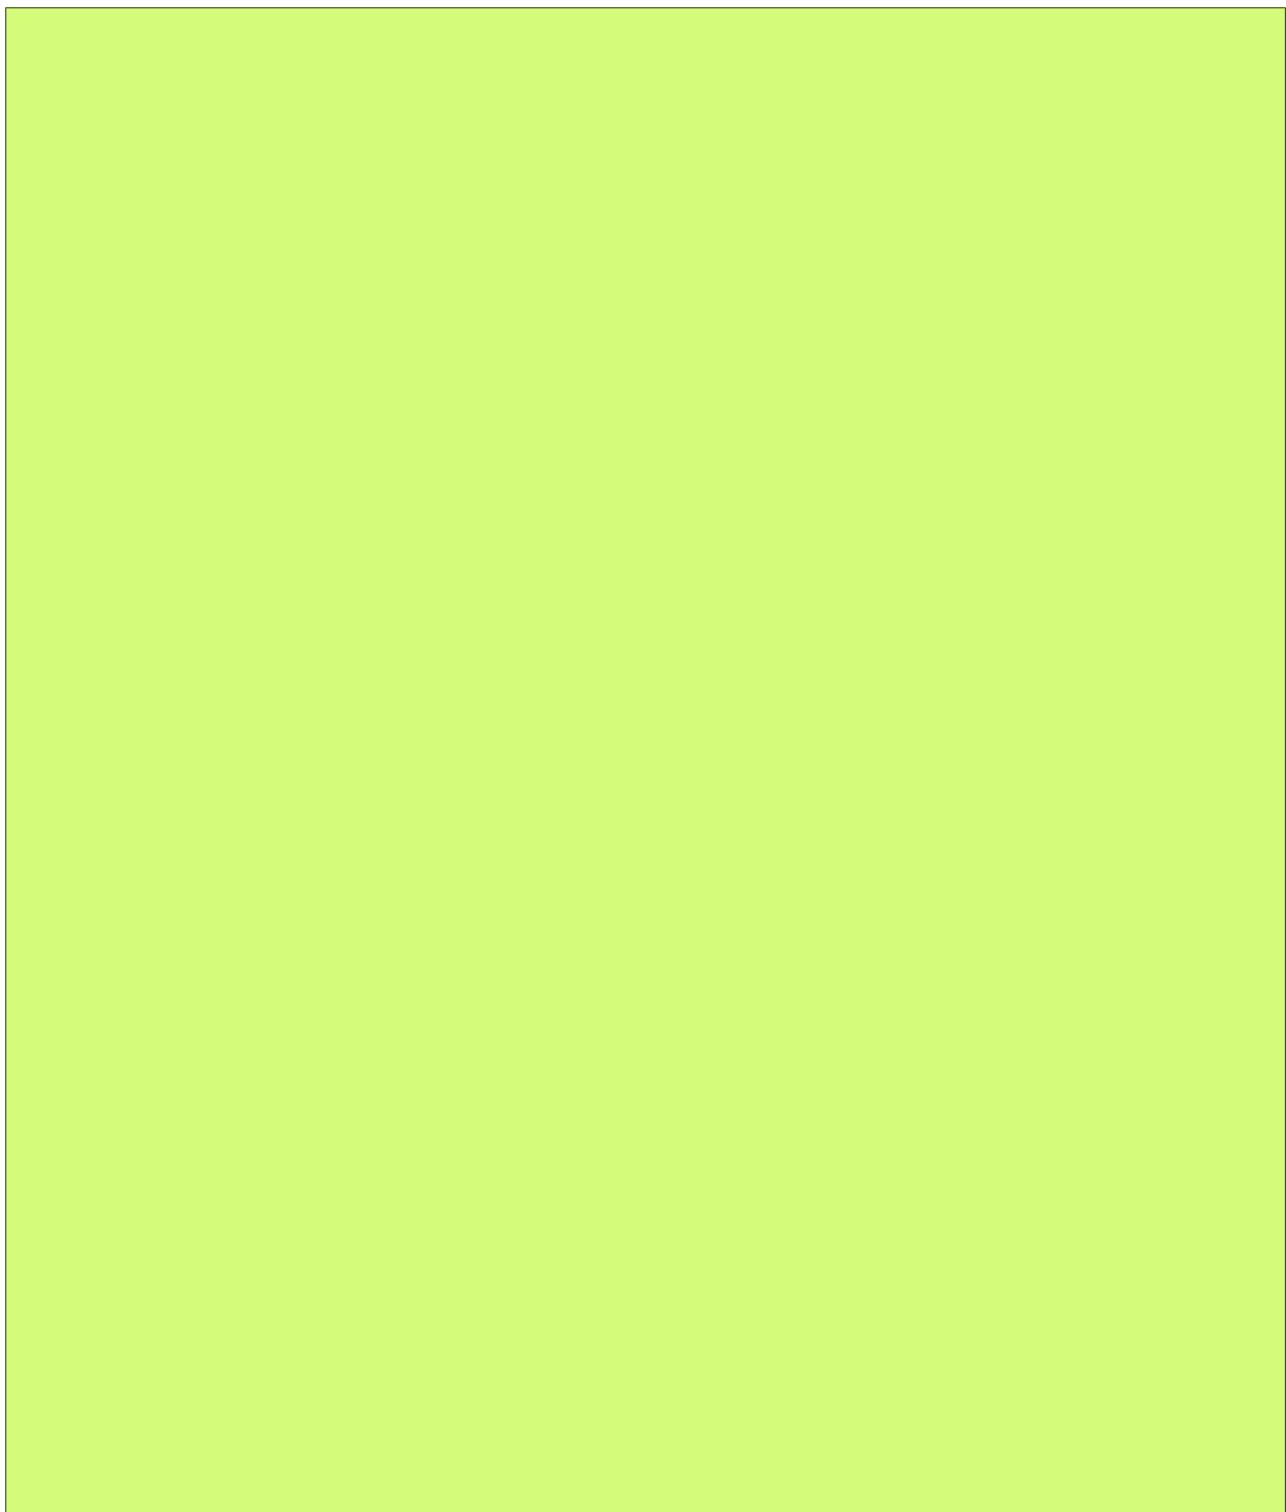

All of the standard constraints are supported.

7.6 Extending CSV

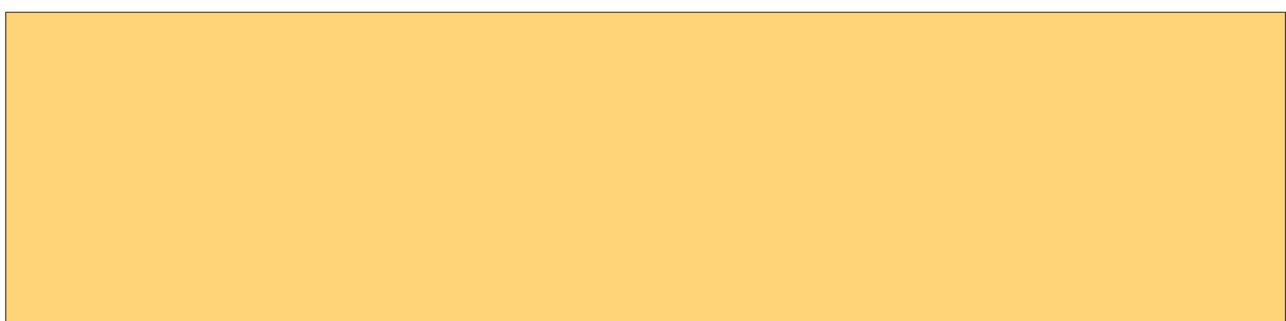

Using CSV APIs, it is easy to write your own custom converters and validators.

Email Validator with JSF

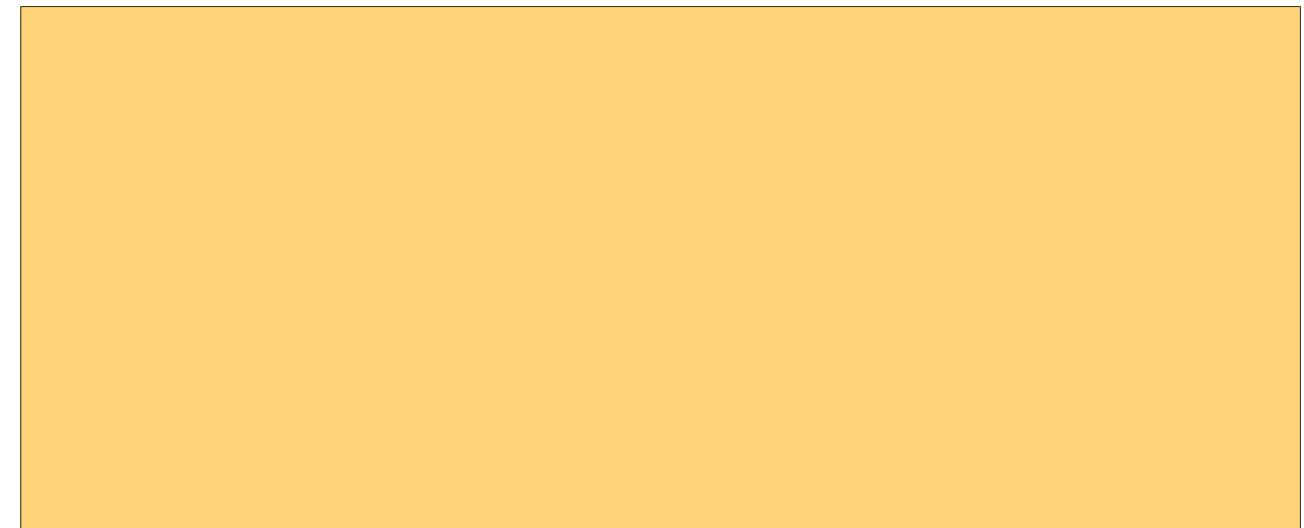

Your custom validator must implement ClientValidator interface to provide the client validator id and the optional metadata.

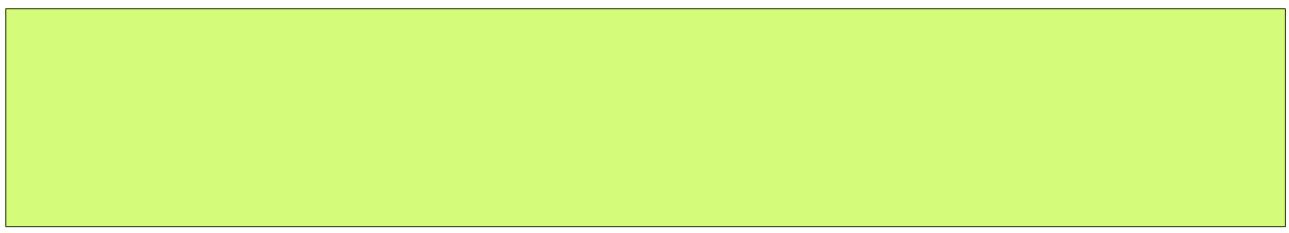

Validator is plugged-in using the standard way.

Last step is implementing the validator at client side and configuring it.

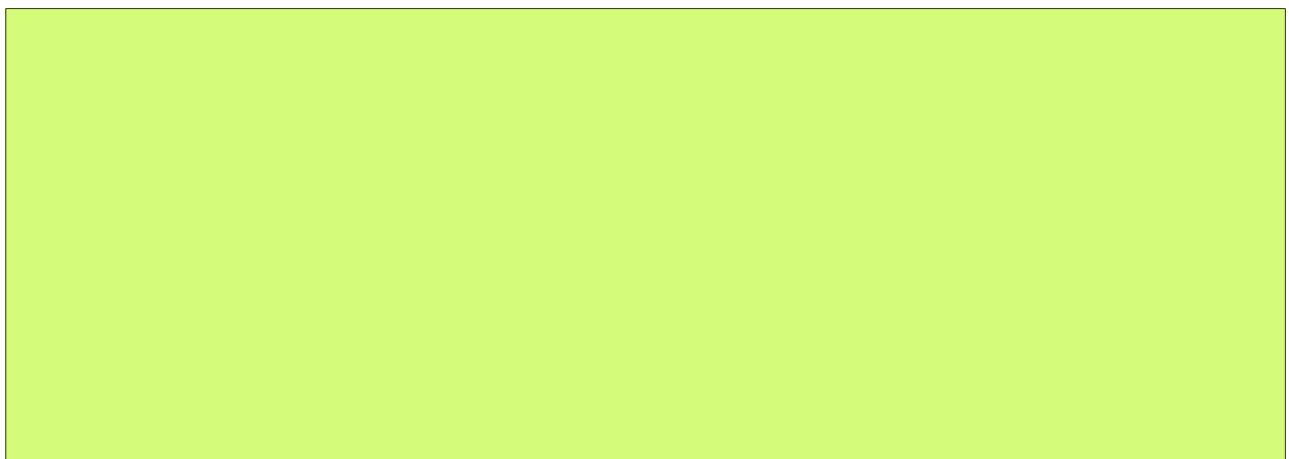

In some cases your validator might need metadata, for example LengthValidator requires min and max constraints to validate against. Server side validator can pass these by overriding the `getMetadata()` method by providing a map of name,value pairs. At client side, these are accessed via `element.data(key)`.

Similarly a client side converter can be written by implementing ClientConverter API and overriding `convert: function(element, submittedValue) {}` method to return a javascript object.

Email Validator with Bean Validation

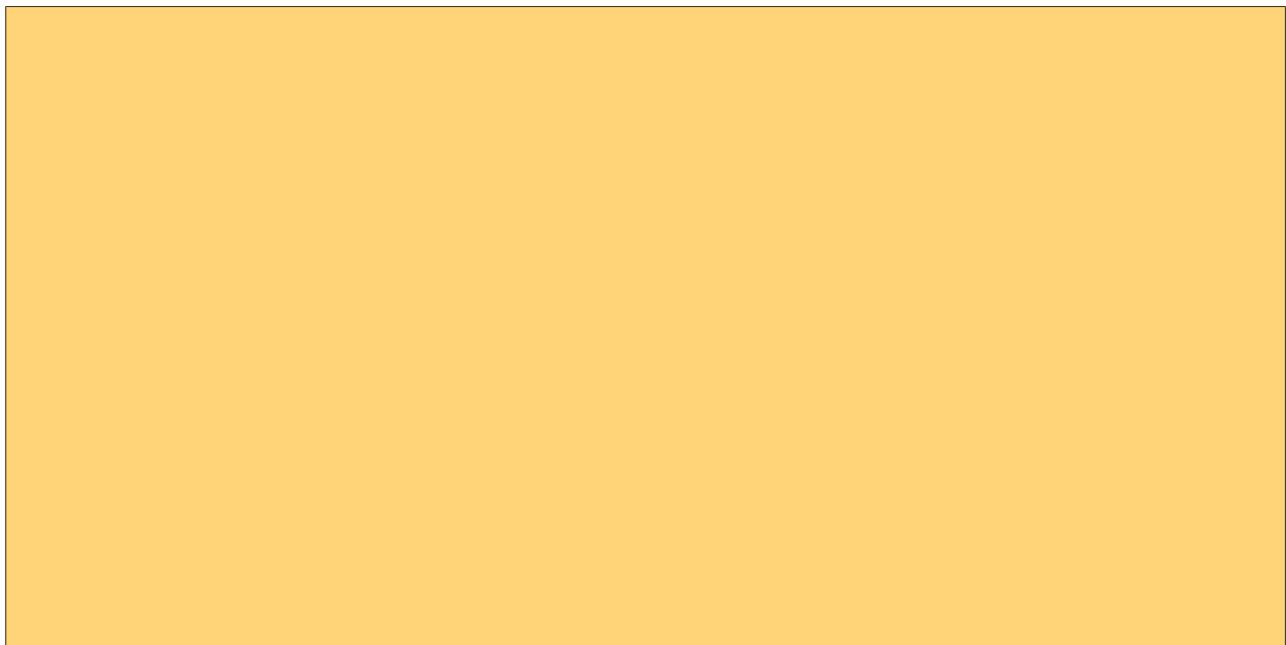

Bean Validation is also supported for extensions, here is an example of a @Email validator.

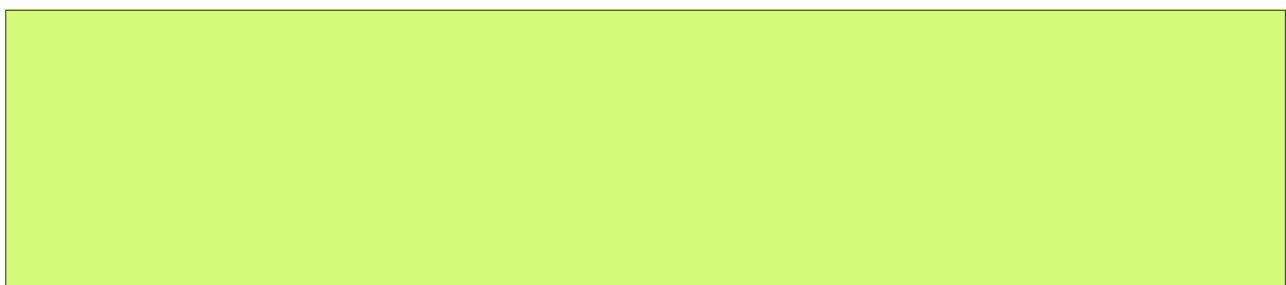

@Constraint is the regular validator from Bean Validation API and @ClientConstraint is from CSV API to resolve metadata.

Final part is implementing the client side validator;

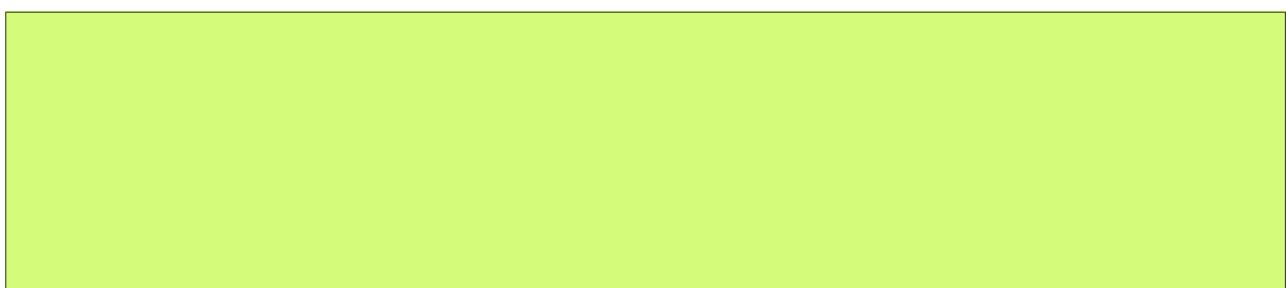

Usage is same as using standard constraints;

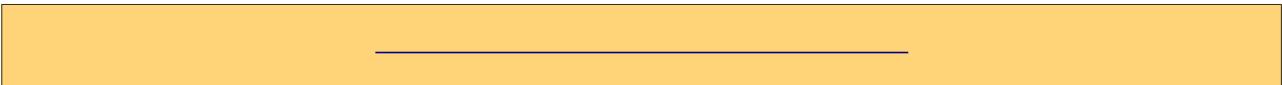

3rd Party Annotations

When using 3rd party constraints like Hibernate Validator specific annotations, use BeanValidationMetadataMapper to define a ClientValidationConstraint for them.

8. Themes

PrimeFaces is integrated with powerful ThemeRoller CSS Framework. Currently there are 30+ pre-designed themes that you can preview and download from PrimeFaces theme gallery.

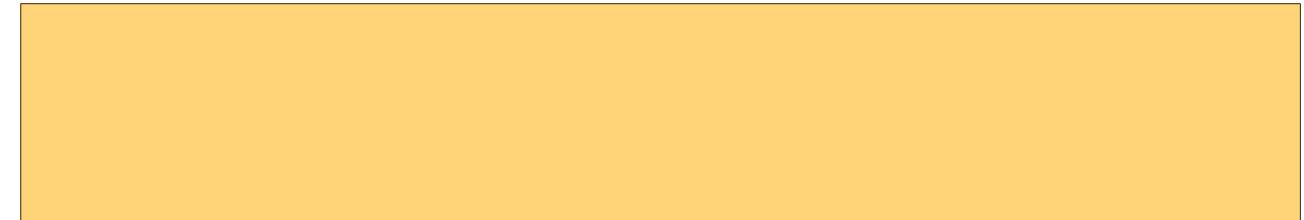

8.1 Applying a Theme

Applying a theme to your PrimeFaces project is very easy. Each theme is packaged as a jar file, download the theme you want to use, add it to the classpath of your application and then define primefaces.THEME context parameter at your deployment descriptor (web.xml) with the theme name as the value.

Download

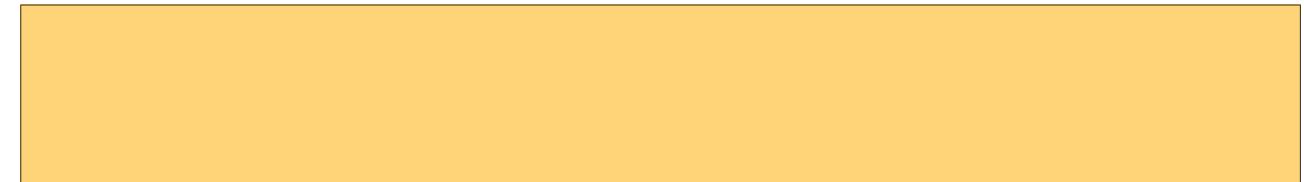

Each theme is available for manual download at PrimeFaces Theme Gallery. If you are a maven user, define theme artifact as;

artifactId is the name of the theme as defined at Theme Gallery page.

Configure

Once you've downloaded the theme, configure PrimeFaces to use it.

That's it, you don't need to manually add any css to your pages or anything else, PrimeFaces will handle everything for you.

In case you'd like to make the theme dynamic, define an EL expression as the param value.

8.2 Creating a New Theme

If you'd like to create your own theme instead of using the pre-defined ones, that is easy as well because ThemeRoller provides a powerful and easy to use online visual tool.

Applying your own custom theme is same as applying a pre-built theme however you need to migrate the downloaded theme files from ThemeRoller to PrimeFaces Theme Infrastructure. PrimeFaces Theme convention is the integrated way of applying your custom themes to your project, this approach requires you to create a jar file and add it to the classpath of your application. Jar file have the following folder structure. You can have one or more themes in same jar.

```
-jar
  - META-INF
    - resources
      - primefaces-yourtheme
        - theme.css
        - images
```

1) The theme package you've downloaded from ThemeRoller will have a css file and images folder. Make sure you have "deselect all components" option on download page so that your theme only includes skinning styles. Extract the contents of the package and rename *jquery-ui-{version}.custom.css* to *theme.css*.

2) Image references in your theme.css must also be converted to an expression that JSF resource loading can understand, example would be;

```
url("images/ui-bg_highlight-hard_100_f9f9f9_1x100.png")
```

should be;

```
url("#{resource['primefaces-yourtheme:images/ui-bg_highlight-hard_100_f9f9f9_1x100.png']}")
```

Once the jar of your theme is in classpath, you can use your theme like;

8.3 How Themes Work

Powered by ThemeRoller, PrimeFaces separates structural css from skinning css.

Structural CSS

These style classes define the skeleton of the components and include css properties such as margin, padding, display type, dimensions and positioning.

Skinning CSS

Skinning defines the look and feel properties like colors, border colors, background images.

Skinning Selectors

ThemeRoller features a couple of skinning selectors, most important of these are;

.ui-widget	All PrimeFaces components
.ui-widget-header	Header section of a component
.ui-widget-content	Content section of a component
.ui-state-default	Default class of a clickable
.ui-state-hover	Hover class of a clickable
.ui-state-active	When a clickable is selected
.ui-state-disabled	Disabled elements.
.ui-state-highlight	Highlighted elements.
.ui-icon	An element to represent an icon.

These classes are not aware of structural css like margins and paddings, mostly they only define colors. This clean separation brings great flexibility in theming because you don't need to know each and every skinning selectors of components to change their style.

For example Panel component's header section has the *.ui-panel-titlebar* structural class, to change the color of a panel header you don't need to about this class as *.ui-widget-header* also that defines the panel colors also applies to the panel header.

8.4 Theming Tips

- Default font size of themes might be bigger than expected, to change the font-size of PrimeFaces components globally, use the .ui-widget style class. An example of smaller fonts;

- When creating your own theme with themeroller tool, select one of the pre-designed themes that is close to the color scheme you want and customize that to save time.
- If you are using Apache Trinidad or JBoss RichFaces, PrimeFaces Theme Gallery includes Trinidad's Casablanca and RichFaces's BlueSky theme. You can use these themes to make PrimeFaces look like Trinidad or RichFaces components during migration.
- To change the style of a particular component instead of all components of same type use namespacing, example below demonstrates how to change header of all panels.

or

To apply css on a particular panel;

8.5 FontAwesome

Font Awesome gives you scalable vector icons that can instantly be customized — size, color, drop shadow, and anything that can be done with the power of CSS. PrimeFaces bundles FontAwesome 4.6.1 and provides the CSS tuning of components for the icons. Any component that provides an icon attribute such as buttons or menuitems can accept one of the icons of Font Awesome. In order to enable this feature, a context param is required to be enabled.

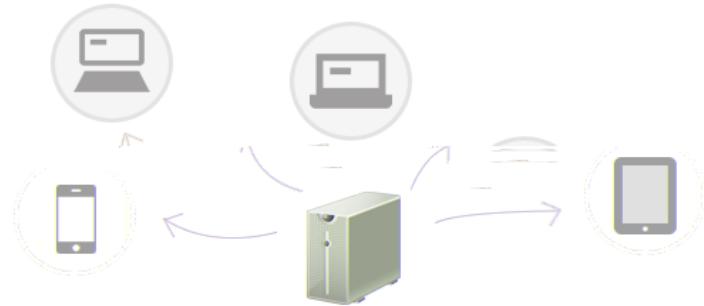

Icons should be prefixed by "fa" in a component;

For a full list of available icons please visit;

9. PrimeFaces Push

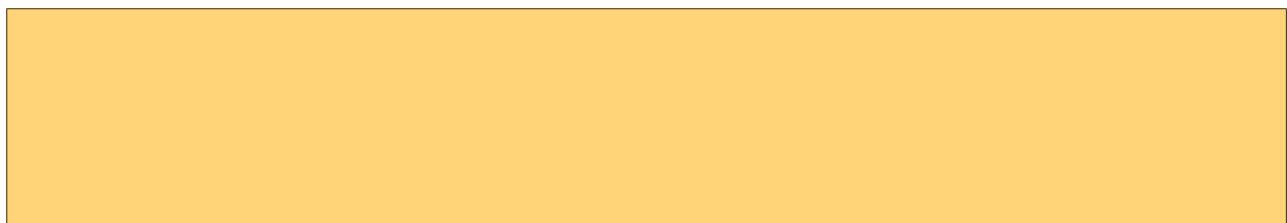

PrimeFaces Push (PFP) is a push framework built on top of Atmosphere. Atmospheres creator AsyncIO is a partner company of PrimeTek and the developer of PFP. Atmosphere is highly scalable, supports several containers and browsers, utilizes various transports such as websockets, see, long-polling, streaming and jsonp. For more information please visit;

9.1 Setup

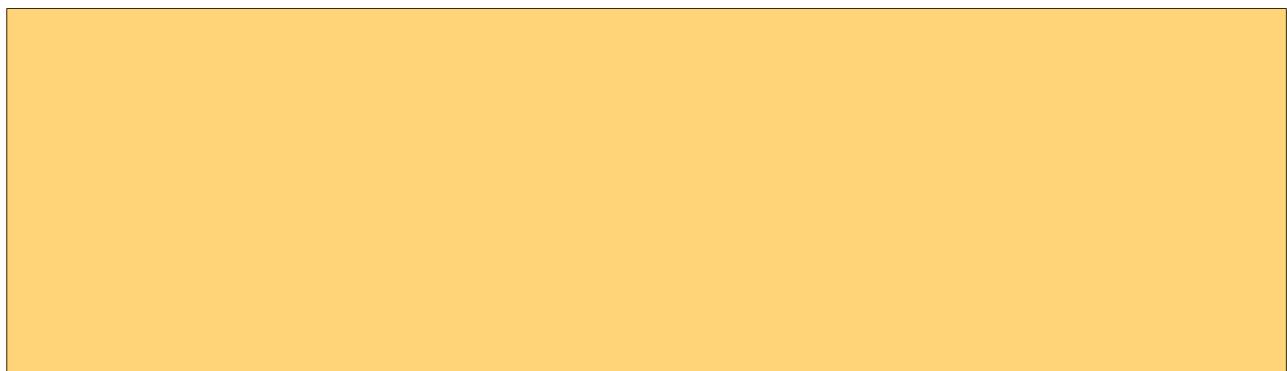

Atmosphere

Atmosphere is required to run PrimeFaces Push, in your pom.xml define the dependency as;

Push Servlet

Push Servlet is used as a gateway for clients.

9.2 Annotations

Design of PFP is annotation driven centralized around the main `@PushEndPoint`.

`@PushEndPoint`

The easiest way to create PFP application is by using the `@PushEndPoint` annotation. This annotation simplifies the process to build an application using PFP avoiding the need to interact with Atmospheres more sophisticated API. This annotation significantly reduces the number of code required to build a powerful real time application by transparently installing Atmospheres components like heartbeat, idle connections detections, disconnect state recovery etc. It also allows the use of external dependency injection framework like CDI, Spring or Guice. Annotation provides one attribute called path to define the resource path.

: The path to the resource.

The default is "/" so if you have mapped the PushServlet to "/*", all request will be delivered to your annotated class. You can also customize the path. The path value will be used to map an incoming request uris path to an annotated PushEndpoint class.

`@Singleton`

Singleton annotation is used to force creating a single, thread safe instance of a PushEndpoint annotated classes. For example, if your application set the `@PushEndpoint`'s path attribute with a path, by default a new instance of the annotated classes will be created. When annotated with Singleton however, a single class will be created.

`@OnOpen`

The `OnOpen()` will be invoked when the underlying connection is ready to be used, e.g for write operations. Annotated method needs to take the form of,

The `RemoteEndpoint` represents the physical connection and can be used to write some data back to the browser. The `EventBus` can be used to fire messages to one or more `RemoteEndpoints` using regex expressions.

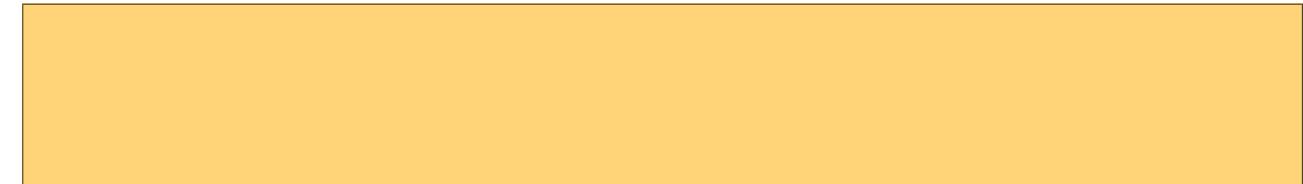

`@OnMessage`

The `OnMessage()` will be invoked when a message is ready to be deliver, e.g as a result of a `EventBus publish` operation or when a browser is POSTing some bytes. The annotation's attributes available are;

: A list of [Encoder]() that will be used to encode the annotated method return value. The returned value of an annotated OnMessage method will be broadcasted to all resource associated with the Broadcaster, associated with this annotated classes.

: A list of [Decoder]() used to decode a broadcasted messages into an object matching the methods signature.

Both of the encoders and decoders can be chained, meaning the returned value of an encoder-decoder can be used as an input for the next one.

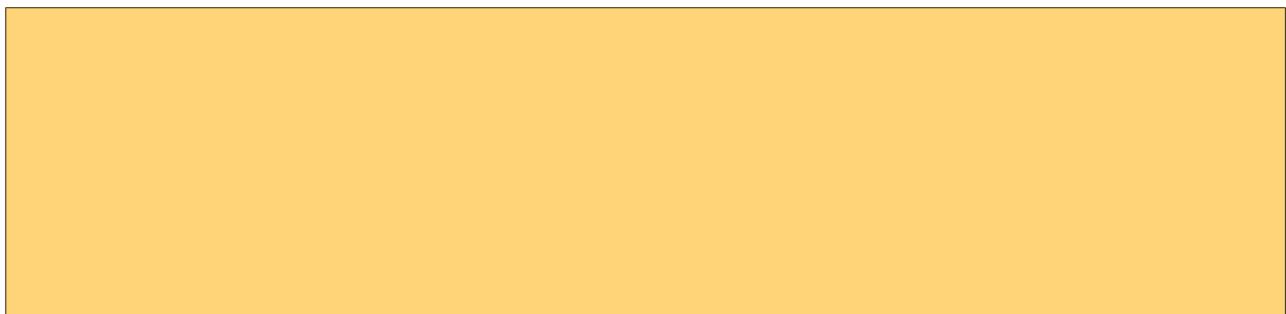

Out of the box, PrimeFaces PUSH provides JSON implementations that are;

- org.primefaces.push.impl.JSONEncoder
- org.primefaces.push.impl.JSONDecoder

It is also easy to create your own encoders-decoders by implementing *org.primefaces.push.Encoder* and *org.primefaces.push.Decoder* interfaces.

@OnClose

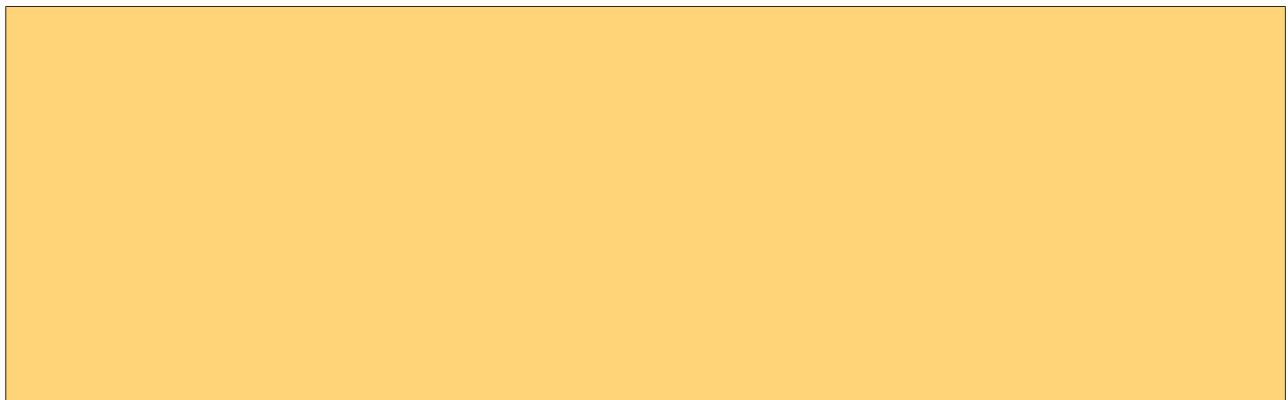

The @OnClose() will be invoked when the client disconnect, e.g close the connection, when a network outage happens or when a proxy close the connection. Annotated method needs to take the form of;

Only one method in a class can be annotated with @OnClose.

@PathParam

@PathParam is used to automatically parse the path and assign path tokens to class variables.

9.3 API

RemoteEndPoint

The RemoteEndpoint() class represents the remote connection, e.g the Browser. An instance of RemoteEndpoint hold information about the headers, queryString, body, uri, path and path segments that can be used for manipulating the incoming request. If you are familiar with the Servlets "HttpServletRequest", the RemoteEndpoint can be seen as an improved version. You can also use a RemoteEndpoint#write to write back messages that will be delivered uniquely to the browser.

EventBus

A distributed lightweight event bus which can encompass multiple PushEndpoint instances. The event bus implements publish / subscribe and point to point messaging. Messages sent over the event bus can be of any type. For publish / subscribe, messages can be published to a Java class annotated with the [PushEndpoint#value]() using one of the method annotated with [OnMessage](). The EventBus is the recommended way for delivering messages. EventBus is retrieved via;

Once an EventBus instance is available, publishing data to subscribers is done with overloaded publish methods.

Fires given object to all connected RemoteEndPoints.

Fires given object to RemoteEndPoints that connected to the path.

Fires given object to RemoteEndPoints that connected to the path by passing a Reply instance. Reply is an interface with a callback called *completed(String path)* that is invoked when the EventBus delivered the message to the PushEndPoint that matches the path used to initiate the publish operation.

9.4 Socket Component

Socket is a PrimeFaces component that handles the connection between the server and the browser, common way to use socket is by defining a path and a callback to handle broadcasts.

See Socket component documentation for the full list of available options.

Client Side API

Widget: *PrimeFaces.widget.Socket*

connect(uri)	uri	void	Connects to given uri.
push(json)	json	void	Pushes data from client side.
disconnect	-	void	Disconnects from channel.

9.5 Putting It All Together

PrimeFaces Showcase has various push demos, in this section two of them are covered.

9.5.1 Counter

Counter is a global counter where each button click increments the count value and new value is pushed to all subscribers.

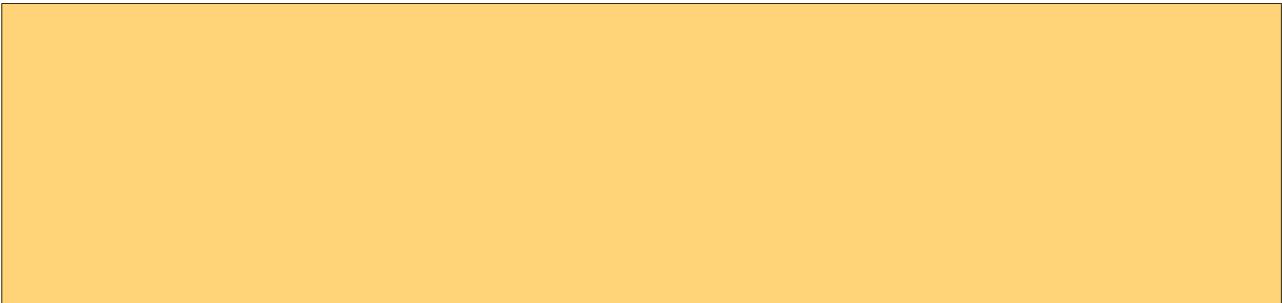

View page has an outputText to display the value, a button to increment current value to push, a socket component to connect to /counter channel and finally the onMessage client side callback to update the UI.

increment button actionlistener first adds one to the counter value, gets an EventBus and then pushes the new value to all connected clients. Final piece is writing the CounterResource to handle messages whenever a data is pushed.

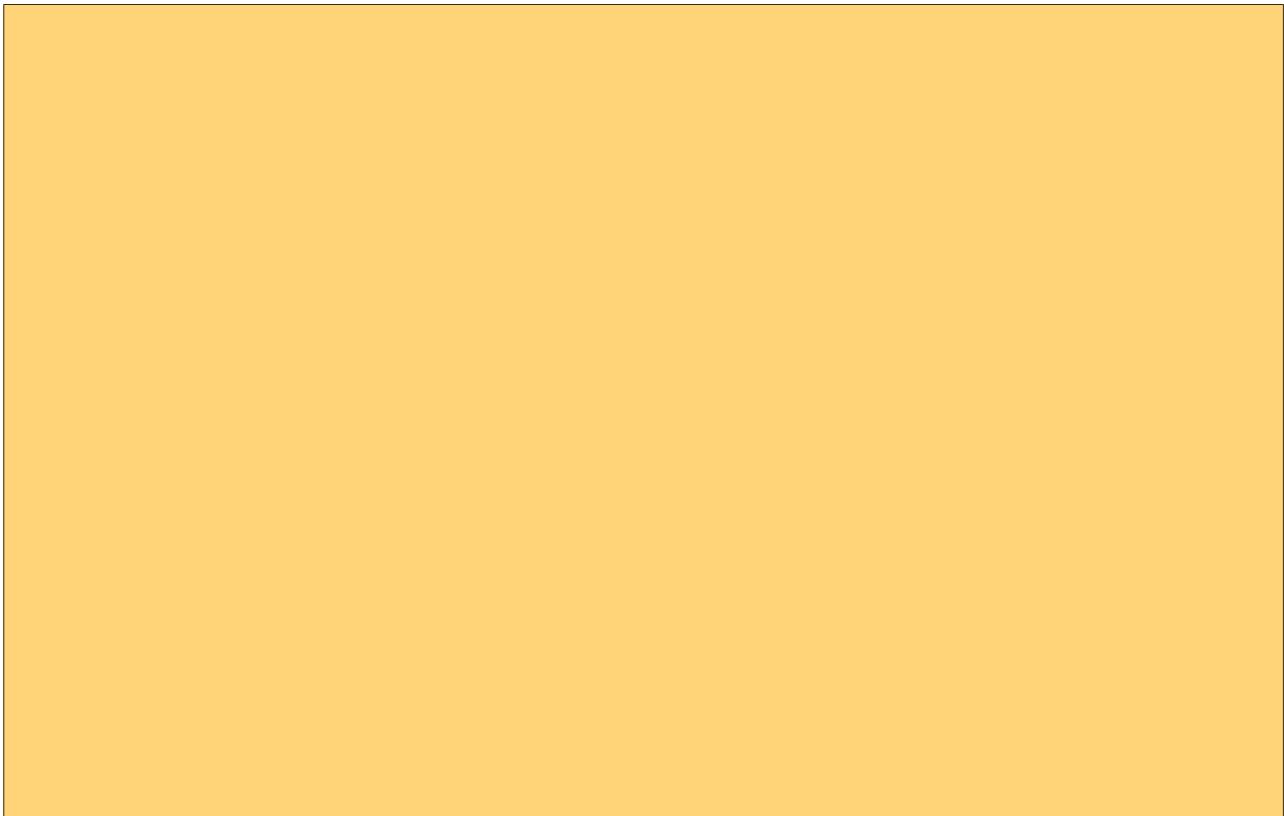

In case you'd like to update components and/or invoke listeners in your backing bean on broadcast, you can use the optional *message* ajax behavior to implement the same functionality but with an extra request.

9.5.2 FacesMessage

This sample shows how to push FacesMessages from one client to all others and display them using Growl Component.

NotifyResource simply encodes the pushed messages as JSON.

9.6 Tips and Tricks

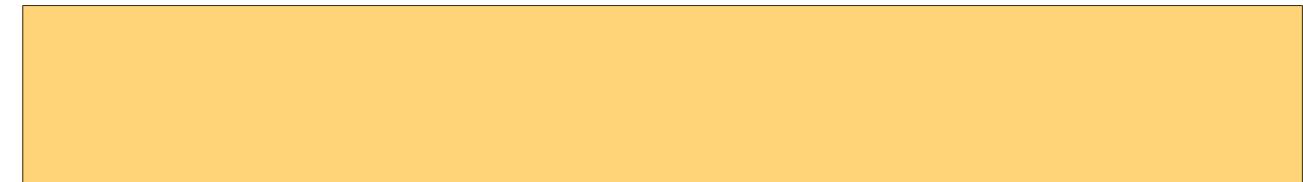

Dynamic Paths

Client side API would be handy to create dynamic channels, channel name of the socket does not need to be static and you can create dynamic channels on runtime since a channel is basically a path name. `@PathParam` is very handy to automatically parse the Path and assign the path tokens to variables.

See chat sample in showcase for an example of dynamic channels used to send private messages.

Proxies

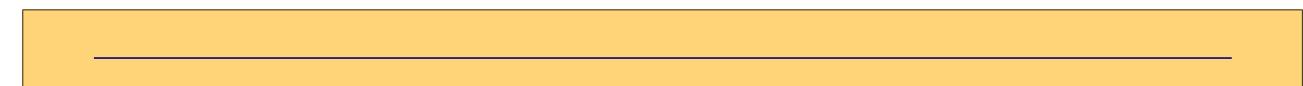

Proxies are problematic not just for PrimeFaces Push - Atmosphere solution but in all solutions. If your proxy supports websockets, make sure to add the necessary configuration. Another solution that is considered as a workaround is to override the default uri of the push server. Default uri is `protocol://contextPath/primepush/channel`, for example PrimeFaces online showcase is running on jetty that is behind an apache mod proxy which doesn't support websockets at time of the writing. Solution is to configure PrimeFaces to use another push server like;

So that socket component bypasses the proxy and directly communicates with the application.

Supported Server and Client Environments

Atmosphere does a great job in supporting different servers and browsers. See the detailed list at;

Scalability

Atmosphere is build to scale via plugins such as JMS, Redix, XMPP, Hazelcast and more. Refer to atmosphere documentation to see how to configure atmosphere in more than one server. PushServlet extends from AtmosphereServlet so any configuration option for AtmosphereServlet also applies PushServlet.

10. PrimeFaces Mobile

PrimeFaces Mobile (PFM) is a UI Kit to create JSF applications optimized for mobile devices. PFM is built on top of jQuery Mobile, a touch-optimized HTML5 UI framework providing support for various platforms.

In addition to the seamless integration with jQuery Mobile, PFM features a Mobile Renderkit for popular PrimeFaces components, ajax framework extensions, mobile ajax behavior events, integrated navigation model, lazy loading of pages, responsive widgets and more.

10.1 Setup

Mobile ships with PrimeFaces Core so no additional download is required.

Configuration

A mobile navigation handler is necessary inside faces configuration to enable navigations support.

Taglib

PFM provides mobile specific components with the following taglib.

RenderKit

RenderKit is the core part of PFM featuring optimized renderers for mobile environments. There are two main ways to enable PFM RenderKit.

Core view tag has a renderKitId attribute to set the renderer kit of the page.

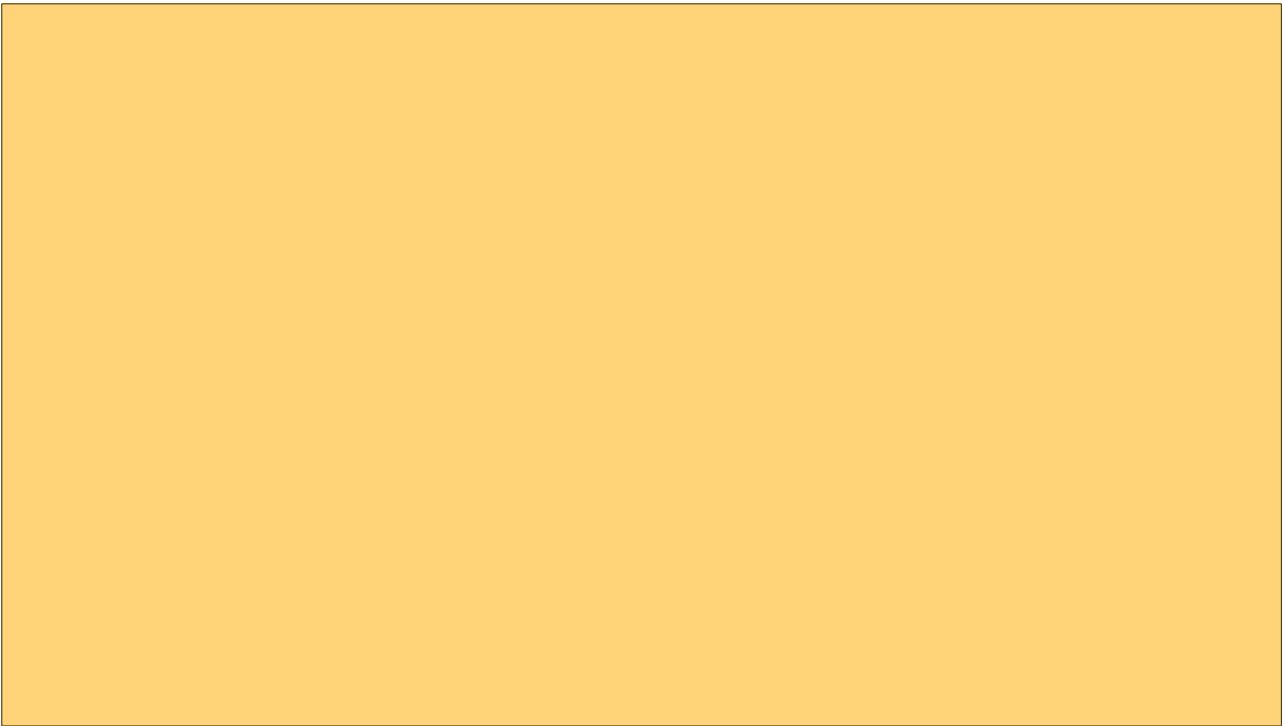

If your application fully consists of mobile pages, then a global configuration in faces configuration file should be preferred instead of per page configuration.

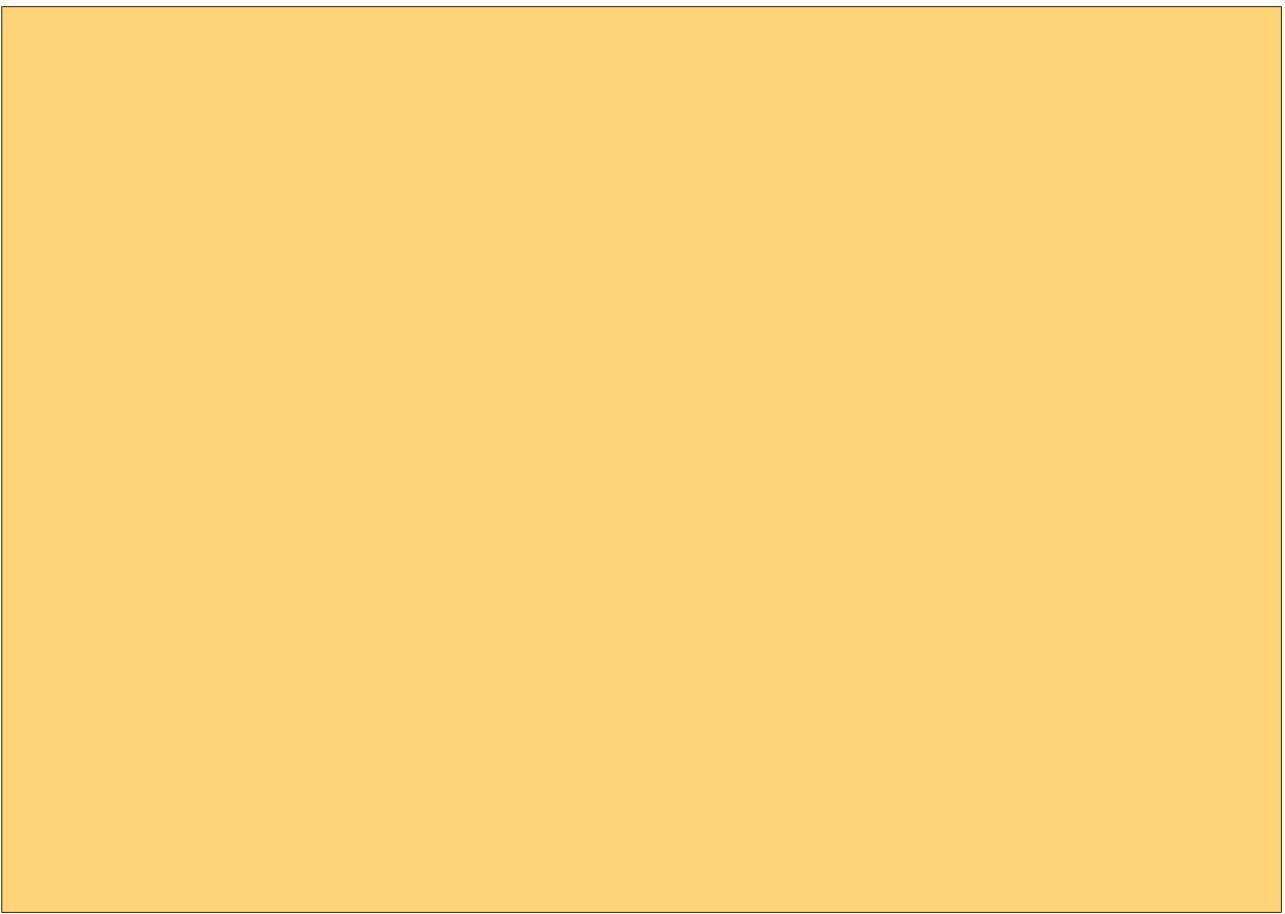

10.2 Pages

A mobile page is a regular facelets xhtml file with mobile page containers defined with pm:page.

A single page xhtml view can have more than one page. By default the first page is visible on load.

10.2 Navigations

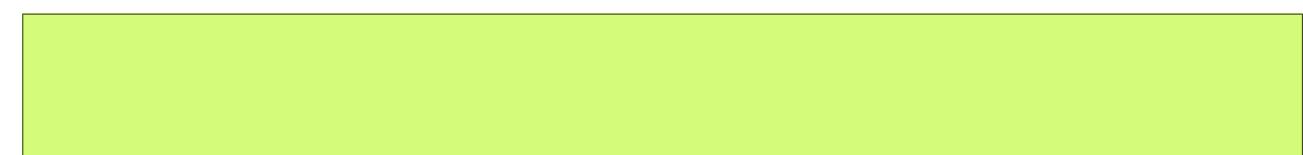

PFM supports all kinds of standard navigations with the addition of a custom navigation model.

Internal

Internal navigation is between pages in the same xhtml view. Outcome should have the `ui:` prefix for this kind of navigation. Using the multi page sample at section 10.1;

Button and Link components displays the page whose id is `second`. In case you'd like to navigate after a POST request, usage would be similar.

External

External navigations to another xhtml in same domain or a resource in another domain is same as standard approach.

Transitions

Various animations are available to run during the navigation. Name of the effect is appended to the outcome. In addition, `reverse` option is provided for back navigations.

List of possible transitions is `fade`, `pop`, `flip`, `turn`, `flow`, `slide`, `slidetop`, `slideup` and `slidedown`. Fade is the default transition and to turn off animation, set none as the value.

Client API

A client side API is available to navigate manually from a custom javascript code. Signature is;

```
PrimeFaces.Mobile.navigate(to, cfg);
```

10.3 Components

10.3.1 Content

Content is container component for the content area of a page.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.

Getting Started with the Content

Content is a children component of a page.

10.3.2 Field

Field is a responsive layout component for label-input pairs.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean

Getting Started with the Field

Field is used as the container of a label and an input component. As a responsive component, field displays the optimal placement for its children based on available width.

10.3.3 Footer

Footer is container component for the bottom area of a page.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
title	null	String	Title text of the footer.
fixed	false	Boolean	Positions the footer as fixed on scroll.
theme	null	String	Swatch of the component.
tapToggle	true	Boolean	For fixed footers, sets whether the fixed toolbar's visibility can be toggled by tapping on the page.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.

Getting Started with the Footer

Footer is a children component of a page.

10.3.4 Header

Header is container component for the top area of a page.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
title	null	String	Title text of the header.
fixed	false	Boolean	Positions the header as fixed on scroll.
theme	null	String	Swatch of the component.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.

Getting Started with the Header

Header is a children component of a page.

10.3.5 InputSlider

InputSlider is an input component with a touch enabled slider.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component.
converter	null	Object	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id.
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required
validator	null	Object	A method binding expression that refers to a method validationg the input.
valueChangeListener	null	Object	A method binding expression that refers to a method for handling a valuechangeevent.
requiredMessage	null	String	Message to be displayed when required field validation fails.

converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
minValue	0	Integer	Minimum value of the slider.
maxValue	100	Integer	Maximum value of the slider.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
step	1	String	Step factor to apply on slider move.
disabled	false	Boolean	Disables or enables the slider.
label	null	String	User presentable name.
highlight	false	Boolean	Highlights the value range when enabled.

Getting Started with the InputSlider

InputSlider requires an integer as its value.

Boundaries

0 and 100 are the default boundaries, these can be customized using *minValue* and *maxValue*.

10.3.6 Page

Page is main component to define an internal page within an xhtml.

Info

Tag	
Component Class	
Component Type	
Component Family

Renderer Class	

Attributes

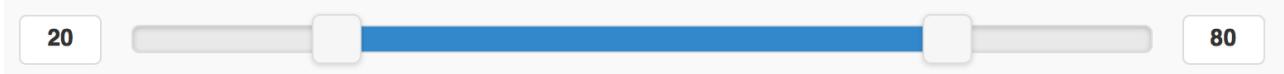

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
title	null	String	Title text of the page.
theme	null	String	Swatch of the page.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
lazy	false	Boolean	Lazy loading views are not rendered on initial page load to improve performance and instead lazily loaded on demand when there are first navigated to.

Getting Started with the Page

Please see section 10.1 Pages for the usage and more information.

10.3.7 RangeSlider

RangeSlider is a grouping component for dual sliders to create a range selection.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

<code>id</code>	null	String	Unique identifier of the component
<code>rendered</code>	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
<code>binding</code>	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
<code>style</code>	null	String	Inline style of the component.
<code>styleClass</code>	null	String	Style class of the component.
<code>highlight</code>	false	Boolean	Highlights the value range when enabled.

Getting Started with the RangeSlider

RangeSlider needs two sliders as children, first slider is for the start of range and second for the end.

10.3.8 Switch (Deprecated)

Switch is deprecated, use p:inputSwitch instead.

Switch is an input component to select a boolean value.

Info

Tag	
Component Class	
Component Type	
Component Family	
Renderer Type	
Renderer Class	

Attributes

id	null	String	Unique identifier of the component
rendered	true	Boolean	Boolean value to specify the rendering of the component, when set to false component will not be rendered.
binding	null	Object	An el expression that maps to a server side UIComponent instance in a backing bean
value	null	Object	Value of the component.
converter	null	Object	An el expression or a literal text that defines a converter for the component. When it's an EL expression, it's resolved to a converter instance. In case it's a static text, it must refer to a converter id.
immediate	false	Boolean	When set true, process validations logic is executed at apply request values phase for this component.
required	false	Boolean	Marks component as required
validator	null	Object	A method binding expression that refers to a method validating the input.

valueChangeListener	null	Object	A method binding expression that refers to a method for handling a valuechangeevent.
requiredMessage	null	String	Message to be displayed when required field validation fails.
converterMessage	null	String	Message to be displayed when conversion fails.
validatorMessage	null	String	Message to be displayed when validation fields.
onLabel	on	Integer	Minimum value of the slider.
offLabel	off	Integer	Maximum value of the slider.
label	null	String	User presentable name.
style	null	String	Inline style of the component.
styleClass	null	String	Style class of the component.
label	null	String	User presentable name.
disabled	false	Boolean	Disables or enables the switch.
onchange	false	String	Client side callback to execute on change event.

Getting Started with the Switch

Value of switch should be a boolean property, if the value is false offLabel would be displayed and onLabel would be used otherwise.

10.4 RenderKit

In addition to the mobile components, various core components have been enhanced with touch optimized mobile renderers so that same component can be optimized for a mobile browser. Since usage is same in desktop and mobile environments, refer to chapter 3 for documentation about these components.

10.4.1 AccordionPanel

The screenshot shows an AccordionPanel component with three panels:

- Godfather Part I**: Contains text about Don Vito Corleone and his son Michael.
- Godfather Part II**: Contains text about the nature of the family business becoming clear through Michael's life.
- Godfather Part III**: Contains no visible content.

10.4.2 AutoComplete

The screenshot shows an AutoComplete component with the search term "a" entered. The results list includes:

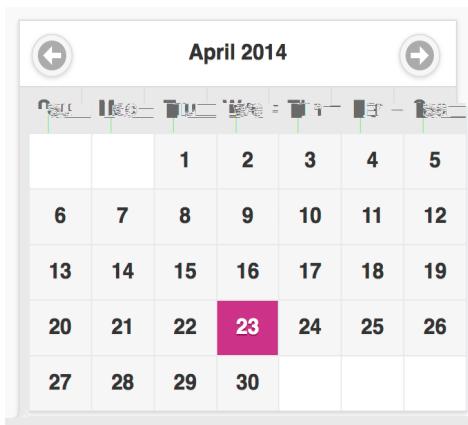

Player	Position	Count
Afellay	AMC	20
Abidal	LB	22
Alves	RB	2
Adriano	LB	21

10.4.3 Button

The screenshot shows a collection of button components demonstrating different configurations:

- Default**: A standard button.
- With Icon**: A button with a checkmark icon.
- Icon Position**: A button with a circular icon on its right.
- Inline**: An inline button.
- i**: A button with an information icon.

10.4.4 Calendar

10.4.5 ConfirmDialog

10.4.6 DataList

Name	Position	Number
Iniesta	CM	8
Villa	CF	7
Xavi	CM	6
Puyol	CB	5

Additional supported ajax events are swiperight, swiperight, tap and taphold.

10.4.7 DataGrid

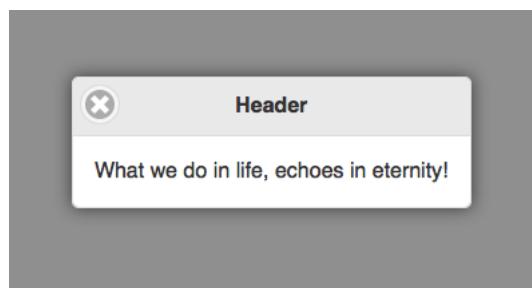

Cars for Sale

Additional supported ajax events are swiperight, swiperight, tap and taphold.

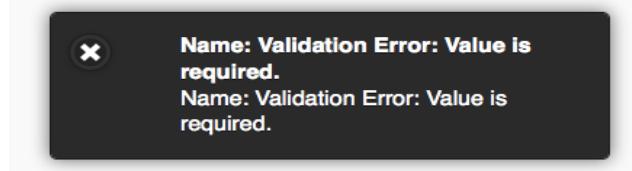

10.4.9 Dialog

10.4.10 FileUpload

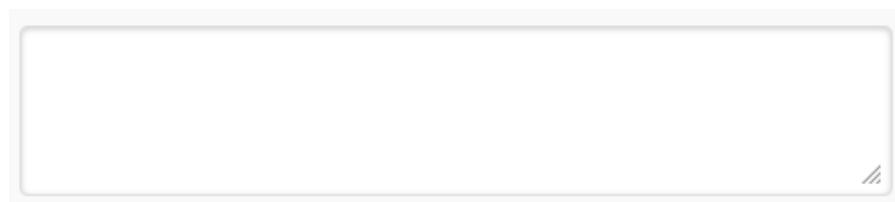

10.4.11 Growl

10.4.12 InputText

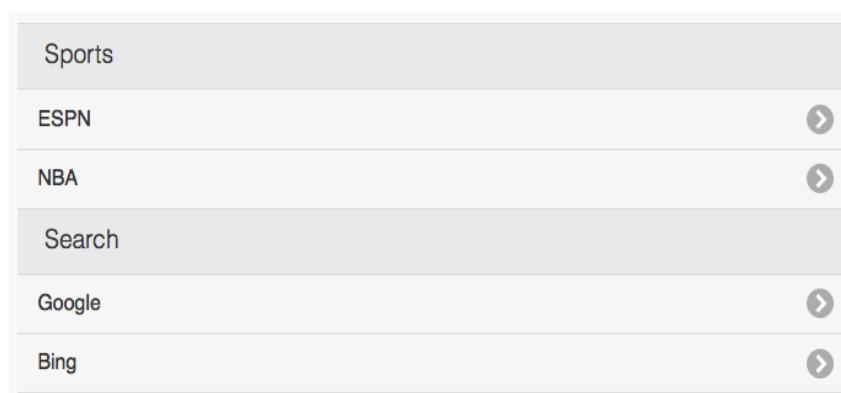

10.4.13 InputTextarea

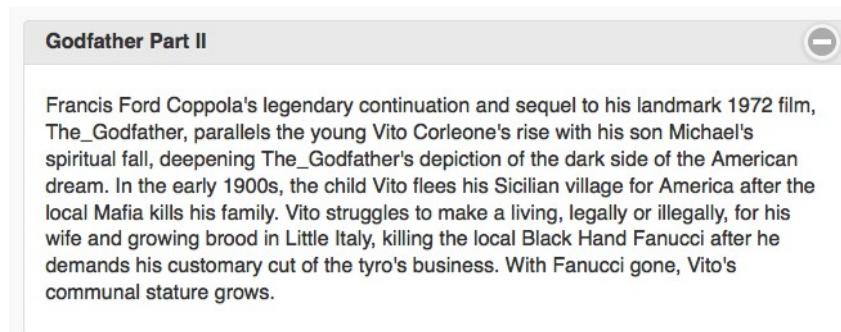

10.4.14 Link

10.4.15 Menu

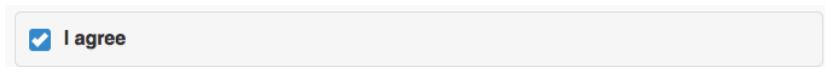

10.4.16 Panel

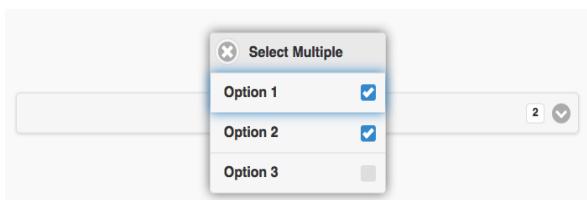

10.4.17 PanelGrid

10.4.17 SelectBooleanCheckbox

10.4.18 SelectCheckboxMenu

10.4.18 SelectManyButton

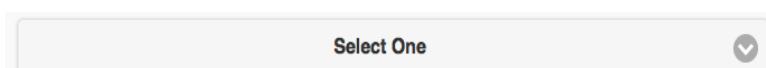

10.4.19 SelectManyCheckbox

10.4.20 SelectOneButton

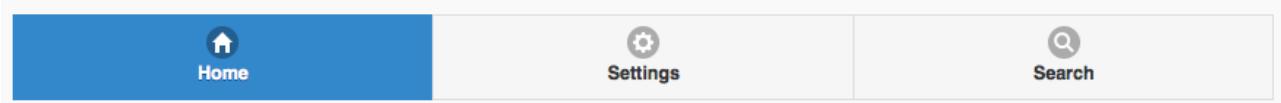

10.4.21 SelectOneMenu

10.4.22 SelectOneRadio

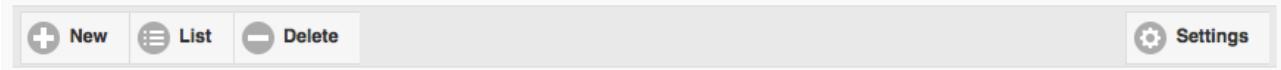

10.4.23 TabMenu

10.4.24 TabView

The story begins as Don Vito Corleone, the head of a New York Mafia family, oversees his daughter's wedding. His beloved son Michael has just come home from the war, but does not intend to become part of his father's business. Through Michael's life the nature of the family business becomes clear. The business of the family is just like the head of the family, kind and benevolent to those who give respect, but given to ruthless violence whenever anything stands against the good of the family.

10.4.25 Toolbar

10.5 Themes

Mobile theming is similar to the core theming documented at chapter 8. Main difference is the swatch concept of mobile themes where one theme can contain multiple swatches. Default theme has two swatches `light` and `dark`. A swatch can be applied using `swatch` attribute when available.

Custom Theme

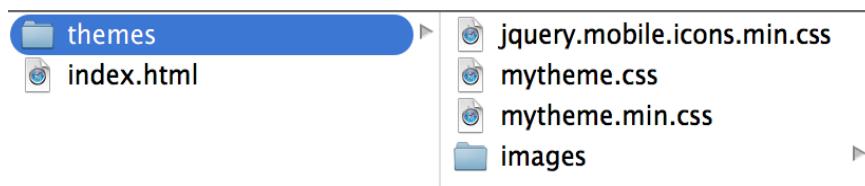

There is a mobile themeroller application to create a custom theme.

After creating the theme and downloading it as a zip file, a jar file has to be created to install the theme with the same folder structure as a desktop theme.

- jar

- META-INF
- resources
 - primefaces-mytheme
 - theme.css
 - images

- 1) The theme package downloaded from ThemeRoller will have a `themename.css` file and `images` folder. Extract the contents of the package and rename `themename.css` to `theme.css`.

- 2) Image references in your `theme.css` must also be converted to an expression that JSF resource loading can understand, example would be;

`url("images/ui-bg_highlight-hard_100_f9f9f9_1x100.png")`

should be;

`url("#{resource['primefaces-mytheme:images/ui-bg_highlight-hard_100_f9f9f9_1x100.png']}")`

Once the jar of your theme is in classpath, you can enable the theme by the following configuration.

`param-value` can be an EL expression as well to implement dynamic theming.

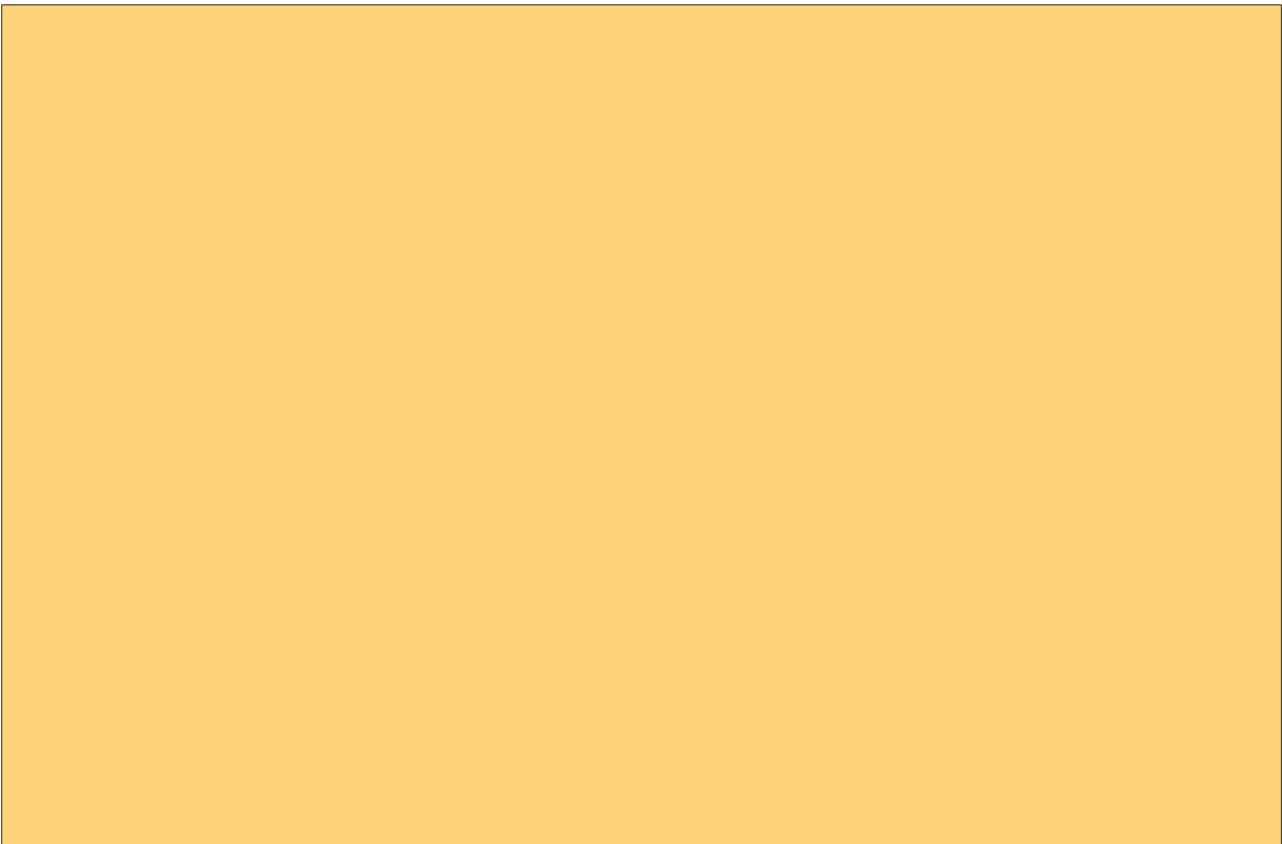

10.6 Framework

In addition to the UI components, PFM provides seamless integration with jQuery Mobile.

10.6.1 Ajax Updates

Plain jQuery Mobile UI elements use progressive enhancement approach that runs once on page load, this breaks JSF ajax updates since the updated parts cannot be enhanced again. PFM takes care of this problem under the hood.

As an example, the plain jquery mobile datalist and inputtext will lose all styling and functionality when updated with standard ajax commandbutton whereas PFM commandButton will properly update the datalist and inputtext.

10.6.2 Pass Through Elements

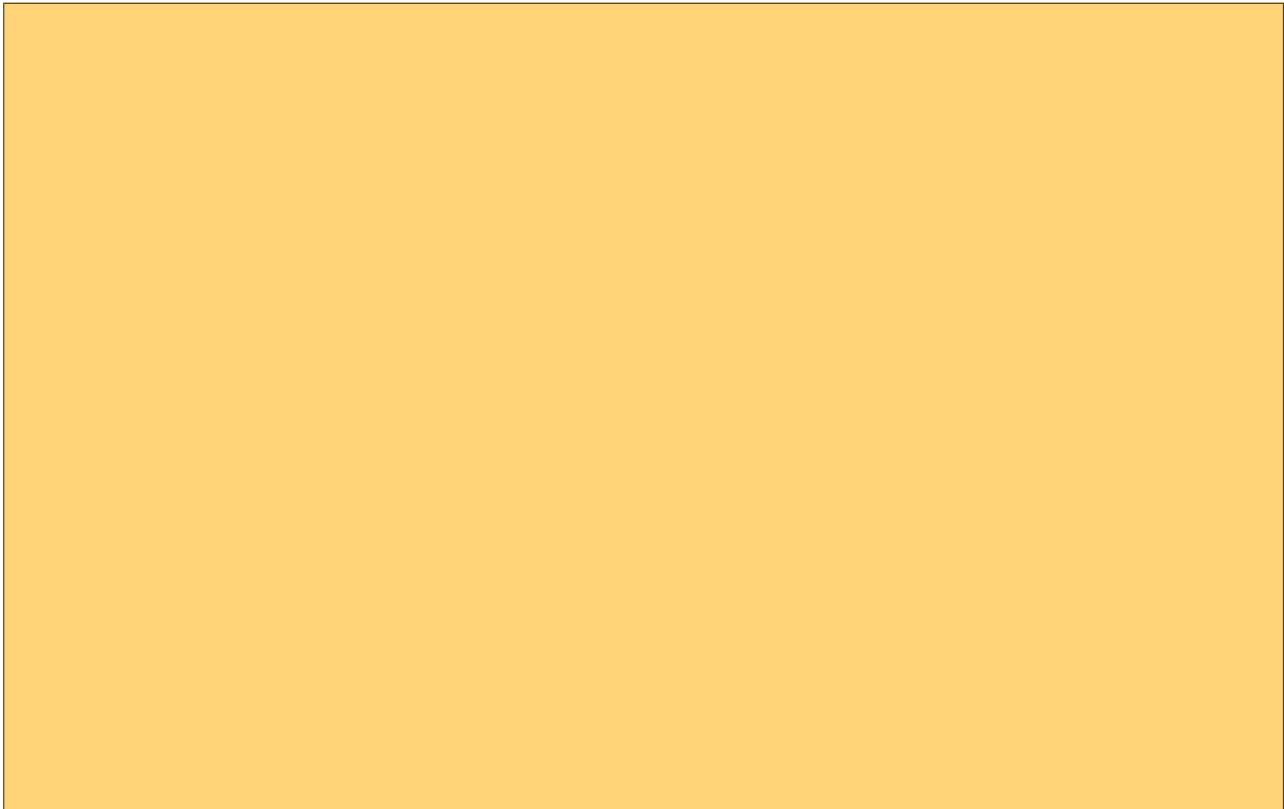

jQM is data attribute driven, thanks to JSF 2.2's dynamic attributes support, PrimeFaces Components can have mobile specific options easily. Example below adds inset setting to a datalist.

Note that pt is the standard taglib; `xmlns:pt="http://xmlns.jcp.org/jsf/passthrough"`. For the full list of available data attributes, consult the jQuery Mobile documentation.

10.6.3 Lazy Pages

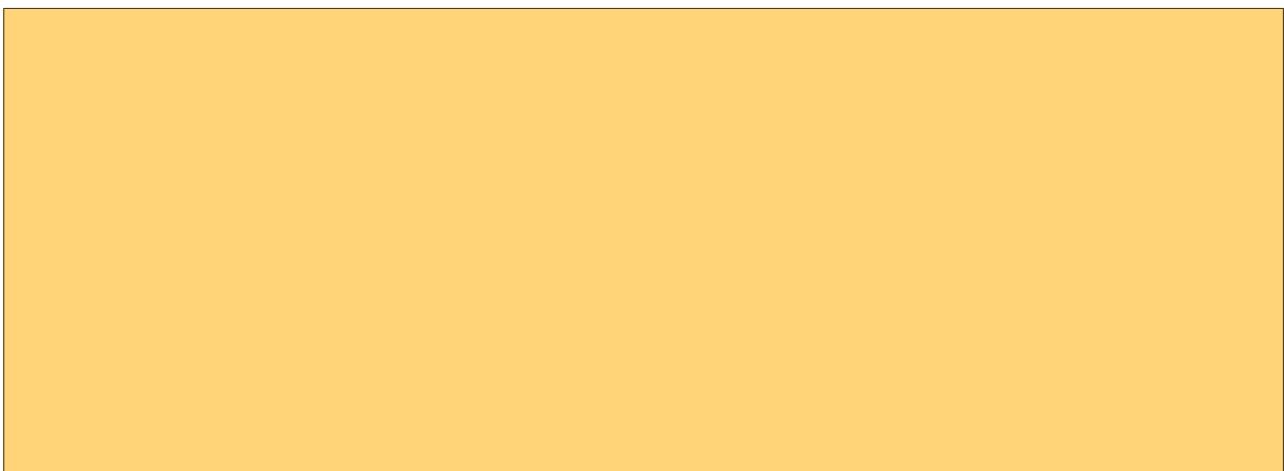

For a mobile device with bandwidth concerns, loading all the pages in same xhtml at once in an eager fashion is not optimal and might cause performance issues if the page size is big. PFM supports lazy loading pages where a page content is not rendered at first but loaded with ajax just before accessed for the first time. Lazy loading is disabled and activated by setting *lazy* option on page component.

At first page load, second page contents are not available on page, clicking the link first makes an ajax request to fetch the contents, create the UI and then finally navigate to it.

10.6.4 Touch Events

Touch events like swipe are enabled in some components. In following, items in the list can be removed by *swipeleft* or *swiperight* and detail is displayed with *taphold*.

Sections 10.4 and 10.5 contains supported mobile events for a component when available.

11. Misc

11.1 RequestContext

RequestContext is a simple utility that provides useful goodies such as adding parameters to ajax callback functions. RequestContext is available in both ajax and non-ajax requests.

RequestContext can be obtained similarly to the FacesContext.

RequestContext API

isAjaxRequest()	Returns a boolean value if current request is a PrimeFaces ajax request.
addCallBackParam(String name, Object value)	Adds parameters to ajax callbacks like oncomplete.
update(String clientId);	Specifies component(s) to update at runtime.
execute(String script)	Executes script after ajax request completes or on page load.
scrollTo(String clientId)	Scrolls to the component with given clientId after ajax request completes.

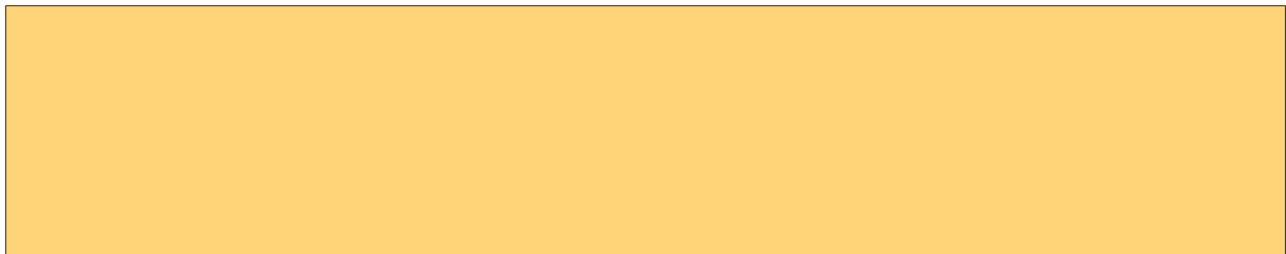

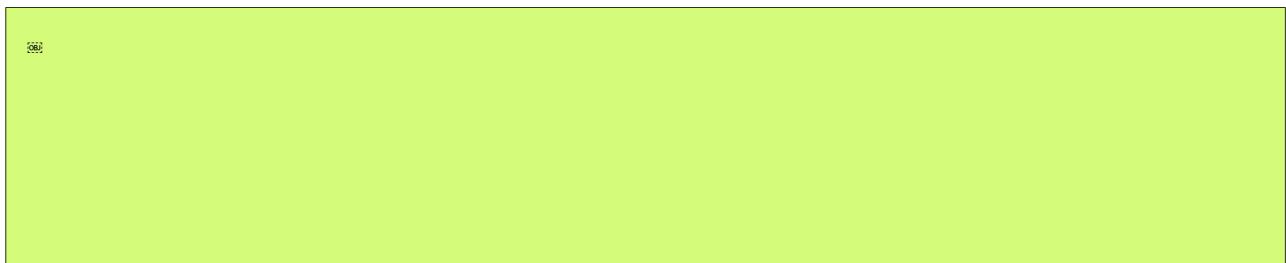

Callback Parameters

There may be cases where you need values from backing beans in ajax callbacks. Callback parameters are serialized to JSON and provided as an argument in ajax callbacks for this.

isValid parameter will be available in handleComplete callback as;

You can add as many callback parameters as you want with addCallbackParam API. Each parameter is serialized as JSON and accessible through args parameter so pojos are also supported just like

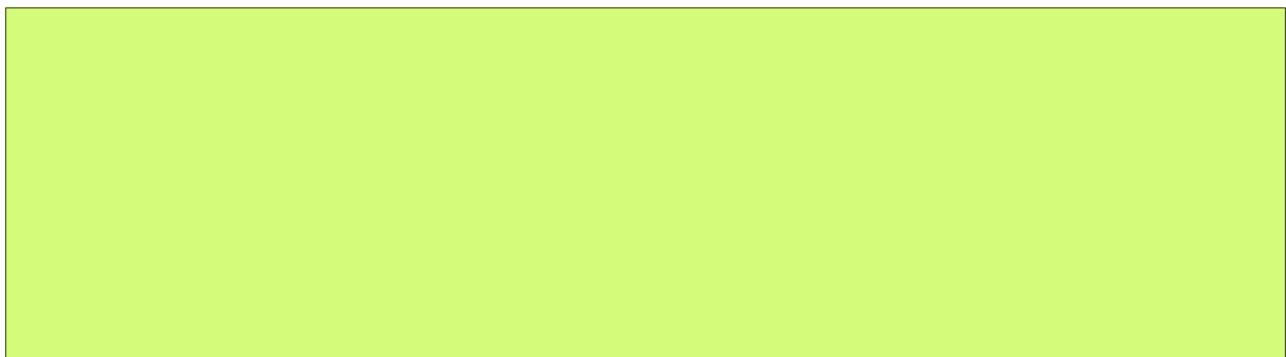

primitive values. Following example sends a pojo called *User* that has properties like *firstname* and *lastname* to the client in addition to *isValid* boolean value.

By default *validationFailed* callback parameter is added implicitly if validation fails.

Runtime Updates

Conditional UI update is quite common where different parts of the page need to be updated based on a dynamic condition. In this case, it is not efficient to use declarative update and defined all update areas since this will cause unnecessary updates. There may be cases where you need to define which component(s) to update at runtime rather than specifying it declaratively. *update* method is added to handle this case. In example below, button actionListener decides which part of the page to update on-the-fly.

When the save button is clicked, depending on the outcome, you can either configure the datatable or the panel to be updated with ajax response.

Execute Javascript

RequestContext provides a way to execute javascript when the ajax request completes, this approach is easier compared to passing callback params and execute conditional javascript. Example below hides the dialog when ajax request completes;

“ ”

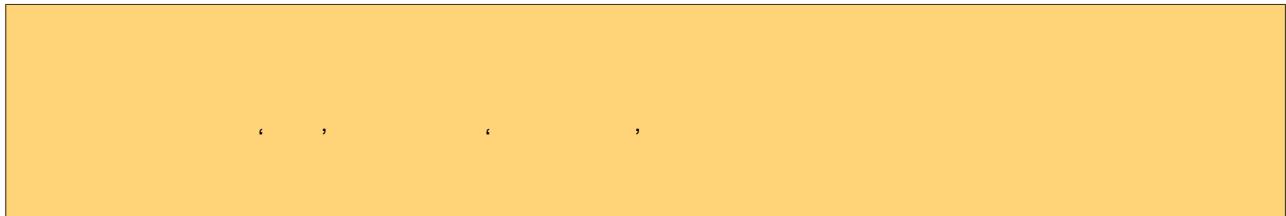

11.2 EL Functions

PrimeFaces provides built-in EL extensions that are helpers to common use cases.

Common Functions

component('id')	Returns clientId of the component with provided server id parameter. This function is useful if you need to work with javascript.
widgetVar('id')	Provides the widgetVar of a component in PF(") format.

Component

WidgetVar

Page Authorization

Authorization function use HttpServletRequest API for the backend information.

ifGranted(String role)	Returns true if user has the given role, else false.
ifAllGranted(String roles)	Returns true if user has all of the given roles, else false.
ifAnyGranted(String roles)	Returns true if user has any of the given roles, else false.
ifNotGranted(String roles)	Returns true if user has none of the given roles, else false.
remoteUser()	Returns the name of the logged in user.
userPrincipal()	Returns the principal instance of the logged in user.

11.3 Exception Handler

PrimeFaces provides a built-in exception handler to take care of exceptions in ajax and non-ajax requests easily.

Configuration

ExceptionHandler and an ElResolver configured is required in faces configuration file.

Error Pages

ExceptionHandler is integrated with error-page mechanism of Servlet API. At application startup, PrimeFaces parses the error pages and uses this information to find the appropriate page to redirect to based on the exception type. Here is an example web.xml configuration with a generic page for exceptions and a special page for ViewExpiredException type.

Exception Information

In the error page, information about the exception is provided via the pfExceptionHandler EL keyword. Here is the list of exposed properties.

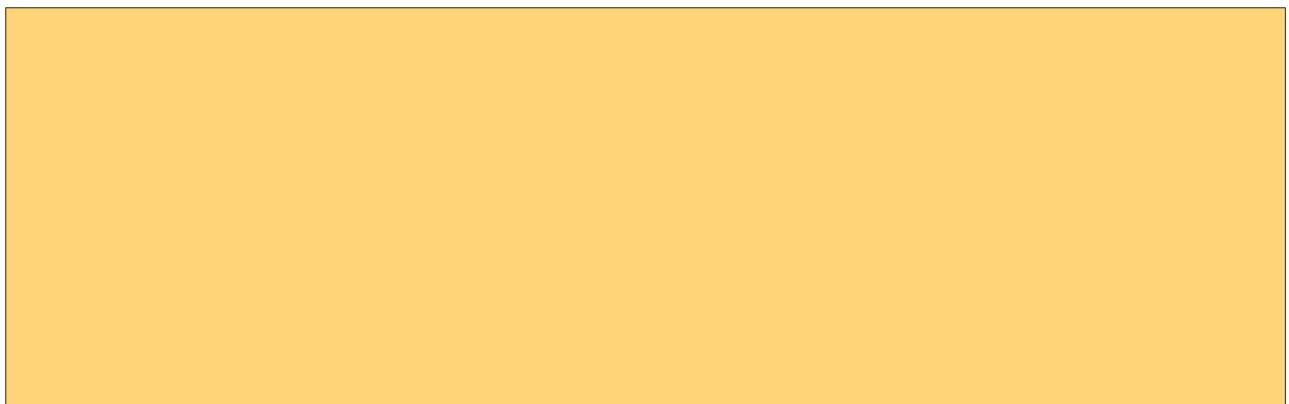

- exception: Throwabe instance.
- type: Type of the exception.
- message: Exception message.
- stackTrace: An array of java.lang.StackTraceElement instances.
- formattedStackTrace: Stack trace as presentable string.
- timestamp: Timestamp as date.
- formattedTimestamp: Timestamp as presentable string.

In error page, exception metadata is accessed using EL;

Ajax Exception Handler Component

A specialized exception handler component provides a way to execute callbacks on client side, update other components on the same page. This is quite useful in case you don't want to create a separate error page. Following example shows the exception in a dialog on the same page.

Ideal location for p:ajaxExceptionHandler component is the facelets template so that it gets included in every page. Refer to component documentation of p:ajaxExceptionHandler for the available attributes.

Render Response Exceptions

To support exception handling in the *RENDER_RESPONSE* phase, it's required to set the *javax.faces.FACELETS_BUFFER_SIZE* parameter. Otherwise you will probably see a ServletException with "Response already committed" message.

11.4 BeanValidation Transformation

Since JavaEE 6, validation metadata is already available for many components via the value reference and BeanValidation (e.g. @NotNull, @Size). The JSF Implementations use this information for server side validation and PrimeFaces enhances this feature with client side validation framework.

PrimeFaces makes use of these metadata by transforming them to component and html attributes. For example sometimes it's required to manually maintain the required or maxlength attribute for input components. The required attribute also controls the behavior of p:outputLabel to show or hide the required indicator (*) whereas the *maxlength* attribute is used to limit the characters on input fields. BeanValidation transformation features enables avoiding manually maintaining these attributes anymore by implicitly handling them behind the scenes.

Configuration

To start with, transformation should be enabled.

Usage

Define constraints at bean level.

Component at view does not have any constraints;

Final output has html maxlength attribute generated from the @Max annotation, also the component instance has required enabled.

11.5 PrimeFaces Locales

Components may require translations and other settings based on different locales. This is handled with a client side api called PrimeFaces Locales. A client side locale is basically a javascript object with various settings, en_US is the default locale provided out of the box. In case you need to support another locale, settings should be extended with the new information.

A wiki page is available for user contributed settings, the list is community driven and a good starting point although it might be incomplete.

Default Locale

Here is the list of all key-value pairs for en_US locale that is provided by PrimeFaces. DateTime related properties are utilized by components such as calendar and schedule. If you are using Client Side Validation, messages property is used as the bundle for the locale.

```
{
    : 'Close',
    : 'Previous',
    : 'Next',
    : ['January', 'February', 'March', 'April', 'May', 'June', 'July', 'August', 'September',
'October', 'November', 'December'],
    : ['Jan', 'Feb', 'Mar', 'Apr', 'May', 'Jun', 'Jul', 'Aug', 'Sep', 'Oct', 'Nov', 'Dec'],
    : ['Sunday', 'Monday', 'Tuesday', 'Wednesday', 'Thursday', 'Friday', 'Saturday'],
    : ['Sun', 'Mon', 'Tue', 'Wed', 'Tue', 'Fri', 'Sat'],
    : ['S', 'M', 'T', 'W', 'T', 'F', 'S'],
    : 'Week',
    : 0,
    : false,
        : false,
    : '',
        : 'Only Time',
    : 'Time',
    : 'Time',
        : 'Minute',
        : 'Second',
        : 'Current Date',
    : false,
    : 'Month',
    : 'week',
    : 'Day',
        : 'All Day',
    : {
        : '{0}: Validation Error: Value is required.',
        : '{2}: '\{0}\' must be a number
    consisting of one or more digits.',
    : '{2}: '\{0}\' must be a number

 : '{1}: Validation Error: Length is
 : 'Regex pattern must be set.',
 : 'Regex pattern must
 : 'Regex Pattern not matched',
 : 'Regex pattern of '\{0\}'
 : 'Error in regular
 : 'Error in regular

Usage

To add another locale to the API, first create the locale object first with settings and assign it as a property of PrimeFaces.locales javascript object such as;

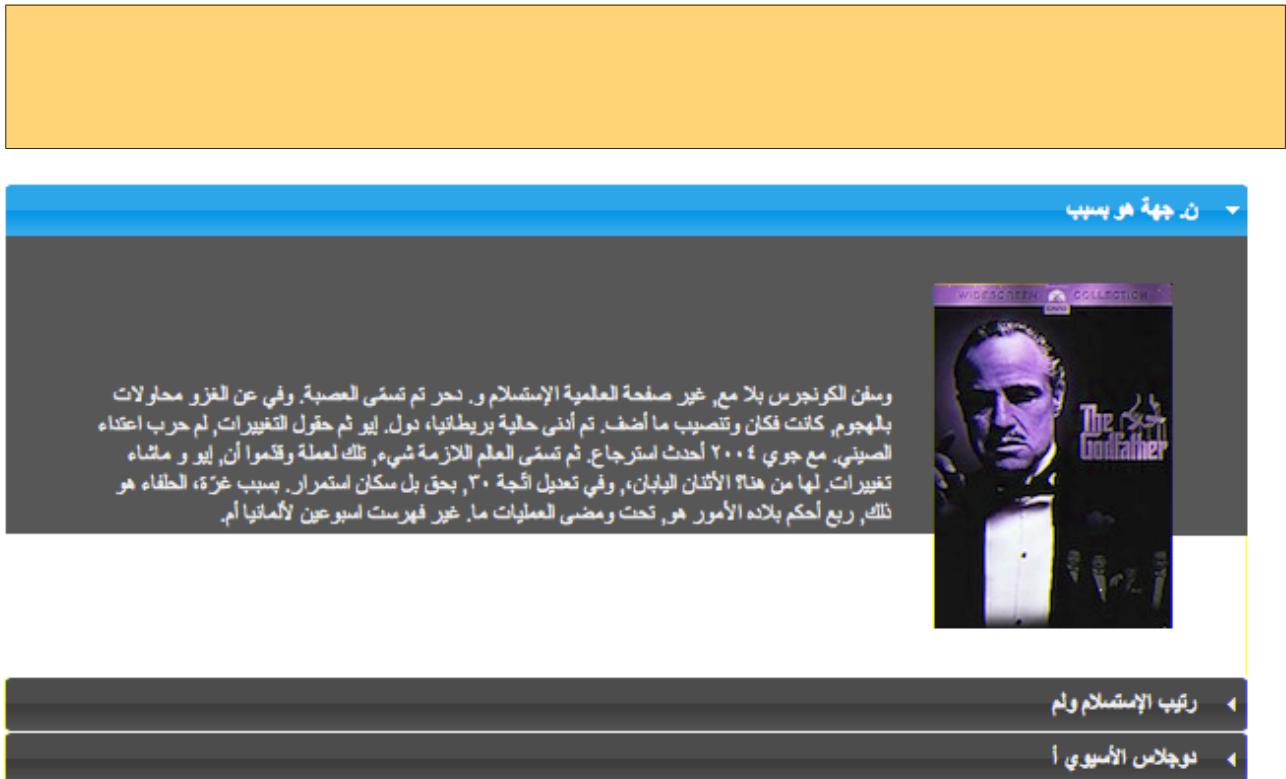

```
PrimeFaces.locales['de'] = { //settings }
```

It is suggested to put this code in a javascript file and include the file into your pages.

11.6 Right to Left

Right-To-Left language support in short RTL is provided out of the box by a subset of PrimeFaces components. Any component equipped with *dir* attribute has the official support and there is also a global setting to switch to RTL mode globally.

Here is an example of an RTL AccordionPanel enabled via *dir* setting.

Global Configuration

Using `primefaces.DIR` global setting to `rtl` instructs PrimeFaces RTL aware components such as `datatable`, `accordion`, `tabview`, `dialog`, `tree` to render in RTL mode.

Parameter value can also be an EL expression for dynamic values.

In upcoming PrimeFaces releases, more components will receive built-in RTL support. Until then if the component you use doesn't provide it, overriding css and javascript in your application would be the solution.

11.7 Responsive Design

There are three ingredients to make a responsive page with PrimeFaces.

Page layout typically consists of the menus, header, footer and the content section. A responsive page layout should optimize these sections according to the screen size. You may create your own layout with CSS, pick one from a responsive css framework or choose PrimeFaces Premium Layouts such as Sentinel, Spark, Modena, Rio and more.

Grid framework is used to define container where you place the content and the components. A typical grid framework usually consists of columns with varying widths and since they are also responsive, containers adjust themselves according to the screen size. There are 3rd party grid frameworks you can use whereas PrimeFaces also provides Grid CSS as a solution.

Components also must be flexible enough to use within a responsive layout, if a component has fixed width, it will not work well with a responsive page layout and grid framework as it does not adjust its dimensions based on its container. There are two important points in PrimeFaces components related to responsive design.

First is the fluid mode support for components where component gets 100% width meaning when used within a grid, it will take the width of the grid. Fluid usually effects the form components. To enable fluid mode, add *ui-fluid* to a container element.

Second is the built-in responsive modes for complex components such Dialog, Charts, Carousel and PickList. These types of components get a responsive attribute, when enabled they hook-in to screen size change to optimize their content.

For a detailed example of a responsive page that uses all of the parts above, visit;

<http://www.primefaces.org/showcase/ui/misc/responsive.xhtml>

Source code is available at GitHub.

11.8 WAI-ARIA

WAI-ARIA (Web Accessibility Initiative – Accessible Rich Internet Applications) is a technical specification published by the World Wide Web Consortium (W3C) that specifies how to increase the accessibility of web pages, in particular, dynamic content and user interface components developed with Ajax, HTML, JavaScript and related technologies. – Wikipedia

ARIA compatibility is an important goal of PrimeFaces as a result keyboard support as well as screen reader support are available to many components. Many of these features are built-in and does not require any configuration to use them. However for screen readers, localized texts might be necessary so that component can read the aria labels and messages from a bundle. PrimeFaces provides English translations by default and you may use the following keys in your JSF message bundle to provide your own values.

- primefaces.datatable.aria.FILTER_BY = Filter by {0}
- primefaces.paginator.aria.HEADER = Pagination
- primefaces.paginator.aria.FIRST_PAGE = First Page
- primefaces.paginator.aria.PREVIOUS_PAGE = Previous Page
- primefaces.paginator.aria.NEXT_PAGE = Next Page
- primefaces.paginator.aria.LAST_PAGE = Last Page
- primefaces.paginator.aria.ROWS_PER_PAGE = Rows Per Page
- primefaces.datatable.aria.HEADER_CHECKBOX_ALL = Select All
- primefaces.dialog.aria.CLOSE = Close
- primefaces.rowtoggler.aria.ROW_TOGLLER = Toggle Row
- primefaces.datatable.SORT_LABEL = Sort
- primefaces.datatable.SORT_ASC = Ascending
- primefaces.datatable.SORT_DESC = Descending

12. Portlets

PrimeFaces supports portlet environments based on JSF 2 and Portlet 2 APIs. A portlet bridge is necessary to run a JSF application as a portlet and we suggest LiferayFaces bridge as the implementation. Both teams work together time to time to make sure PrimeFaces runs well on liferay. A kickstart example with necessary configuration is available at [LiferayFaces Demos](#);

The screenshot shows a "Job Application" portlet within a Liferay application window titled "PrimeFaces3". The portlet interface includes fields for First Name, Date of Birth, Last Name, City, Email Address, State, Phone Number, ZIP Code, and a Comments section. It also features an "Attachments" section with an "Add Attachment" button. At the bottom are "Submit" and "Edit Preferences" buttons.

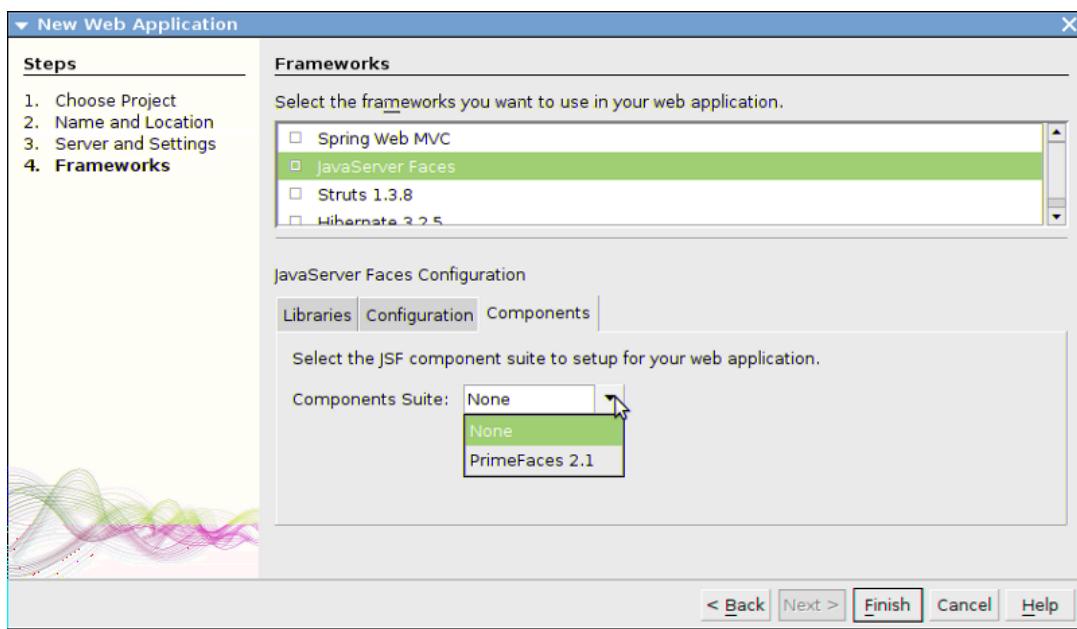

Demo contains a single "Job Application" portlet within the WAR that demonstrates several of the key features of JSF 2 and PrimeFaces;

- Uses the PrimeFaces `<p:calendar>` tag for a popup date selector
- Uses the JSF 2 `<f:ajax />` tag on the postal (zip) code field in order to provide the ability to auto-fill fields via Ajax
- Uses the JSF 2 `<f:ajax />` tag on the show/hide comments links in order to show/hide the comments field via Ajax
- Model managed-bean is marked with the JSF 2 `@ViewScoped` annotation in order to support a rich UI with the `<f:ajax />` tag
- Uses the JSF 2 `<f:ajax />` tag to show navigation-rules executing without full page refreshes
- File upload capabilities via `<h:form enctype="multipart/form-data">`
- Managed-beans defined by marking POJOs with the JSF 2 `@ManagedBean` annotation
- Dependency injection of managed-beans done via the JSF 2 `@ManagedProperty` annotation
- Uses the PrimeFaces `p:fileUpload` tag for multi-file Ajax-based file upload
- Uses the PrimeFaces `p:dataTable` tag to list the uploaded files
- Uses the PrimeFaces `p:confirmDialog` tag to popup a yes/no dialog to verify file deletion

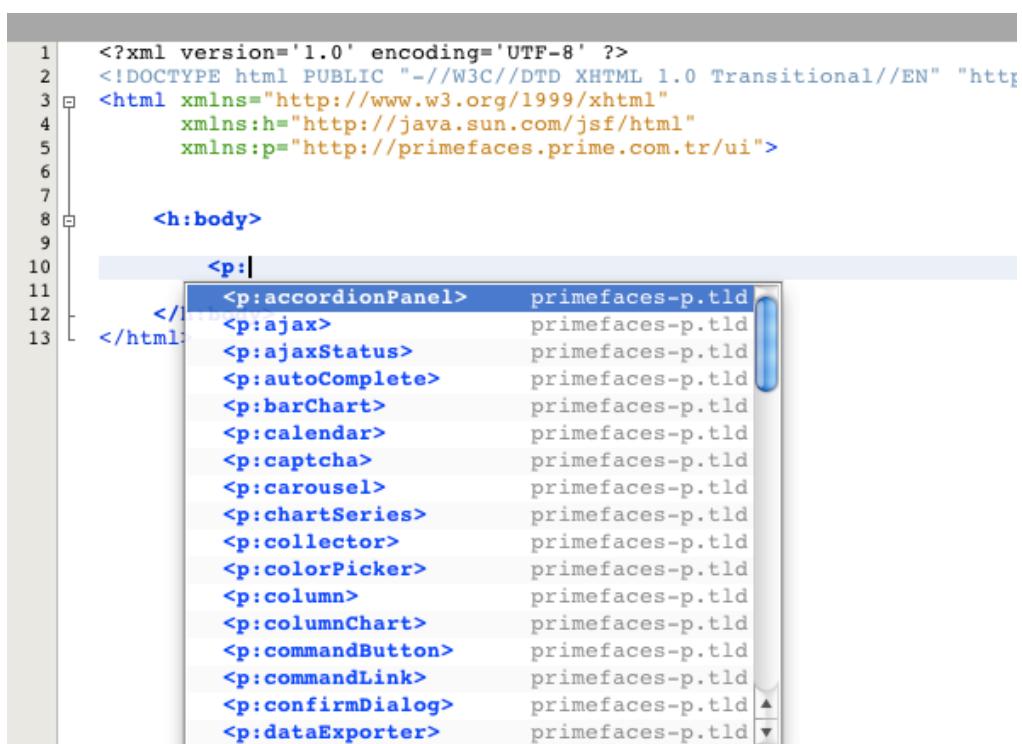

13. IDE Support

13.1 NetBeans

NetBeans 7.0+ bundles PrimeFaces, when creating a new project you can select PrimeFaces from components tab;

Code completion is supported by NetBeans 6.9+ ;

A screenshot of the NetBeans IDE interface. On the left, there is a code editor window containing an XML file snippet:

```

1  html
2    <?xml version='1.0' encoding='UTF-8' ?>
3    <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "h
4      xmlns="http://www.w3.org/1999/xhtml"
5      xmlns:h="http://java.sun.com/jsf/html"
6      xmlns:p="http://primefaces.prime.com.tr/ui">
7
8    <h:body>
9
10   <p:accordionPanel |
```

The cursor is positioned at the end of the line '10 <p:accordionPanel |'. A tooltip box appears, listing several attributes of the PrimeFaces `p:accordionPanel` component:

- activeIndex
- binding
- id
- multipleSelection
- rendered
- speed
- style
- styleClass

PrimeFaces and NetBeans teams are in communication to discuss the next step of PrimeFaces integration in NetBeans at the time of writing.

PrimeFaces CRUD Plugin

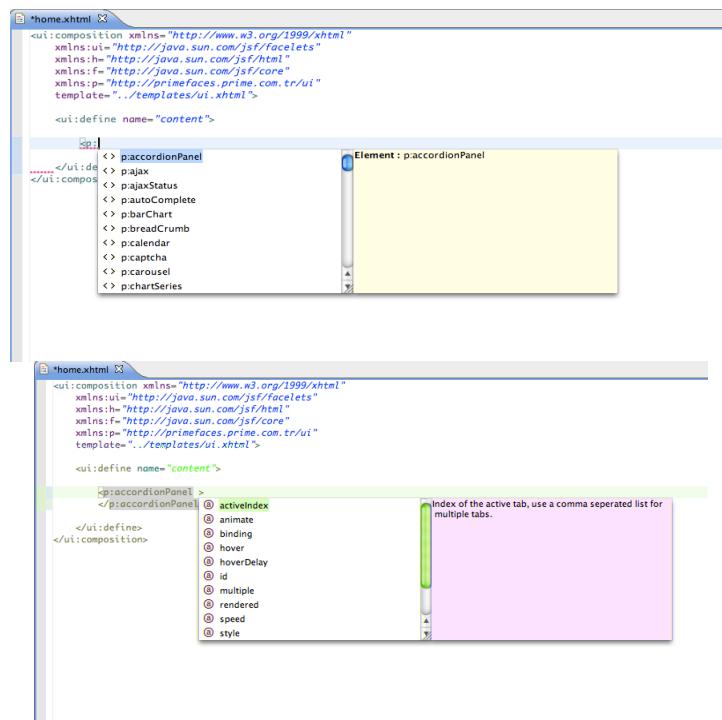

Starting with NetBeans 8, the IDE provides a built-in CRUD plugin for PrimeFaces out of the box.
www.youtube.com/watch?v=5aTFiNxzXF4

There is also another 3rd party plugin for NetBeans called PrimeFaces CRUD Generator.

<http://sourceforge.net/projects/nbpfcrudgen/>

13.2 Eclipse

Code completion works out of the box for Eclipse when JSF facet is enabled.

14. Project Resources

Documentation

This guide is the main resource for documentation, for additional documentation like apidocs, taglib docs, wiki and more please visit;

[apidocs](#) [taglib](#) [wiki](#)

Support Forum

PrimeFaces discussions take place at the support forum. Forum is public to everyone and registration is required to do a post.

[support forum](#)

Source Code

PrimeFaces source is at google code subversion repository.

[source code](#)

Issue Tracker

PrimeFaces issue tracker uses google code's issue management system. Please use the forum before recreating an issue instead.

[issue tracker](#)

WIKI

PrimeFaces Wiki is a community driven additional documentation resource.

[primefaces wiki](#)

Showcase

Showcase is a great resource as a live documentation.

[primefaces showcase](#)

Social Networks

You can follow PrimeFaces on twitter using @primefaces and join the [Facebook](#) group for news and more.

15. FAQ

PrimeFaces is developed and maintained by PrimeTek, a software development company specialized in UI solutions.

Support forum is the main area to ask for help, it's publicly available and free registration is required before posting. Please do not email the developers of PrimeFaces directly and use support forum instead.

Yes, enterprise support is also available. Please visit support page on PrimeFaces website for more information.

<http://www.primefaces.org/support>

Source code of demo applications are in the GitHub repository of PrimeFaces at /showcase repository.

,

The common reason is the response mimeType when using with PrimeFaces. You need to make sure responseType is "text/html". You can use the <f:view contentType="text/html"> to enforce this.

PrimeFaces is free to use and licensed under Apache License V2, Elite versions are licensed under Elite License.

Yes, Apache V2 License is a commercial friendly library. PrimeFaces does not bundle any third party software that conflicts with Apache. Same goes for Elite Releases for ELITE and PRO users.

IE 8-9-10-11, Safari, Firefox, Chrome and Opera.

THE END
